Metabolomic Data

Combined Data Clustering

Visualization

Annotation and Enrichment

MathIOmica is an omics analysis package designed to facilitate method development for the analysis of multiple omics in Mathematica, particularly for dynamics (time series/longitudinal data). This extensive tutorial follows the analysis of multiple dynamic omics data (transcriptomics, proteomics, and metabolomics from human samples). Various MathIOmica functions are introduced in the tutorial, including additional discussion of related functionality. We should note that the approach methods are simply an illustration of MathIOmica functionality, and should not be considered as a definitive appoach. Additionally, certain details are included to illustrate common complications (e.g. renaming samples, combining datasets, transforming accessions from one database to another, dealing with replicates and Missing data, etc.).

After a brief discussion of data in MathIOmica, each example data (transcriptome, proteome and metabolome) are imported and preprocessed. Next a simulation is carried out to obtain datasets for each omics used to assess statistical significance cutoffs. The datasets are combined, and classified for time series patterns, followed by clustering. The clusters are visualized, and biological annotation of Gene Ontology (GO) and pathway analysis (KEGG: Kyoto Encyclopedia of Genes and Genomes) are finally considered.

N.B.1 For a more streamlined/simple example with less discussion please check out the tutorial on MathIOmica Dynamic Transcriptome.

N.B.2 We highly recommend the saving of intermediate results whenever possible. Some functions perform lengthly intensive computations and the performance may vary from system to system. Please use Put to save expressions to a file, and equivalently Get to recover these expressions.

Loading the MathlOmica Package

The functions defined in the MathIOmica` context provide support for conducting analyses of omics data (See also the MathIOmica Overview).

This loads the package:

In[1]:= << MathIOmica`</pre>

Also we can load MathIOmica as:

In[1]:= Needs["MathIOmica`"]

Data in MathlOmica

In this section we will discuss the data objects in use by MathIOmica, particularly the format of an OmicsObject. The data in the tutorial will be imported as an OmicsObject which is first described in this section. Then we present the example data included with MathIOmica. The example data will be imported in subsequent sections to illustrate analysis methods available in MathIOmica.

Data Format: OmicsObject

In MathIOmica the calculations utilize what we term an omics object (OmicsObject). An OmicsObject is an association of associations with some additional characteristics. It has an external (outer) association to denote samples and an internal (inner) association for annotation.

OmicsObject Structure

In an OmicsObject the outer association has M outer labels as keys, corresponding to M samples. Across the samples there are N inner labels (e.g. identifiers for genes/proteins), and the the inner labels are the same across samples. For a given j^{th} outer label, OuterLabel, the k^{th} inner label, InnerLabel, has a value of:

InnerLabel_k \rightarrow {{Measurements_{jk}}, {Metadata_{jk}}}

OmicsObject structure:

```
< | OuterLabel_1 \rightarrow < | InnerLabel_1 \rightarrow \{ \{ Measurements_{11} \}, \{ Metadata_{11} \} \}, 
       InnerLabel<sub>2</sub> \rightarrow {{Measurements<sub>12</sub>}, {Metadata<sub>12</sub>}},
       InnerLabel<sub>3</sub> \rightarrow {{Measurements<sub>13</sub>}, {Metadata<sub>13</sub>}},
       . . . ,
      InnerLabel<sub>k</sub> \rightarrow {{Measurements<sub>1k</sub>}, {Metadata<sub>1k</sub>}},
      InnerLabel<sub>N</sub> \rightarrow {{Measurements<sub>1N</sub>}, {Metadata<sub>1N</sub>}}|>,
  OuterLabel<sub>2</sub> \rightarrow < | InnerLabel<sub>1</sub> \rightarrow { {Measurements<sub>21</sub>}, {Metadata<sub>21</sub>}},
       InnerLabel<sub>2</sub> \rightarrow {{Measurements<sub>22</sub>}, {Metadata<sub>22</sub>}},
      InnerLabel<sub>3</sub> \rightarrow {{Measurements<sub>23</sub>}, {Metadata<sub>23</sub>}},
      InnerLabel<sub>k</sub> \rightarrow {{Measurements<sub>2k</sub>}, {Metadata<sub>2k</sub>}},
      InnerLabel<sub>N</sub> \rightarrow {{Measurements<sub>2N</sub>}, {Metadata<sub>2N</sub>}}|>,
  OuterLabel<sub>i</sub> \rightarrow <|InnerLabel<sub>1</sub> \rightarrow {{Measurements<sub>i1</sub>}, {Metadata<sub>i1</sub>}},
      InnerLabel<sub>2</sub> \rightarrow {{Measurements<sub>12</sub>}, {Metadata<sub>12</sub>}},
      InnerLabel<sub>3</sub> \rightarrow {{Measurements<sub>i3</sub>}, {Metadata<sub>i3</sub>}},
      \texttt{InnerLabel}_k \rightarrow \; \{\, \{\, \texttt{Measurements}_{jk} \} \,, \; \{\, \texttt{Metadata}_{jk} \} \,\} \,,
      . . . ,
      InnerLabel<sub>N</sub> \rightarrow {{Measurements<sub>iN</sub>}, {Metadata<sub>iN</sub>}}|>,
  OuterLabel<sub>M</sub> \rightarrow < | InnerLabel<sub>1</sub> \rightarrow { {Measurements<sub>M1</sub>}, {Metadata<sub>M1</sub>}},
      InnerLabel<sub>2</sub> \rightarrow {{Measurements<sub>M2</sub>}, {Metadata<sub>M2</sub>}},
      \texttt{InnerLabel}_3 \rightarrow \; \{\, \{\, \texttt{Measurements}_{\texttt{M3}} \,\} \,, \; \{\, \texttt{Metadata}_{\texttt{M3}} \,\} \,\} \,,
      InnerLabel<sub>k</sub> \rightarrow {{Measurements<sub>Mk</sub>}, {Metadata<sub>Mk</sub>}},
      InnerLabel<sub>N</sub> \rightarrow {{Measurements<sub>MN</sub>}, {Metadata<sub>MN</sub>}}|>
|>
```

For any jth outer label, OuterLabel_j, it is possible that the mth inner label, InnerLabel_m is missing and takes a Missing[] value in the form InnerLabel_m \rightarrow Missing[]. This can happen if the measurement was not performed for the sample, or no value was recorded (e.g. mass sectrometry data).

```
In[2]:= \mbox{ omicsObjectExample } = \langle \mbox{ "FirstSample"} \rightarrow \langle \mbox{ { (0.937), {17)}, {"A0MZ66"}} \rightarrow { (1.059), {9)}, {"A1A4S6"}} \rightarrow { (1.03), {11}}, {"A1L0T0"} \rightarrow { (1.268), {4}}, {"A0FGR8"} \rightarrow { Missing[]}, {"SecondSample"} \rightarrow \langle \mbox{ { (0.403), {17}}, {"A0MZ66"}} \rightarrow { (0.921), {24}} \mbox{ { (0.779), {11}}, {"A1L0T0"}} \rightarrow { (0.917), {4}}, {"A0FGR8"} \rightarrow { (0.921), {24}} \mbox{ { (1.064), {19}}, {"A0MZ66"}} \rightarrow { (0.87), {23}} \mbox{ { (0.87), {23}}} \mbox{ } \mbox{ { (0.87), {23}}} \mbox{ } \mbox{ } \mbox{ { (0.87), {23}}} \mbox{ } \mbox{ } \mbox{ } \mbox{ } \mbox{ { (0.87), {23}}} \mbox{ } \mbox{ } \mbox{ } \mbox{ } \mbox{ } \mbox{ { (0.87), {23}}} \mbox{ } \m
```

The outer labels of an OmicsObject are strings, while the inner labels are typically lists of strings.

Methods to Import Data as an OmicsObject

There are multiple methods to import data as an OmicsObject using MathIOmica. Four functions assist with importing data directly from text files:

- (i) DataImporter provides a graphical dynamic interface that utilizes file headers to assist with the creation of OmicsObject variables from multiple files.
- (ii) The OmicsObjectCreator function provides a function to create an OmicsObject from already existing/imported data in a Mathematica notebook.
- (iii) DataImporterDirect and (iv) DataImporterDirectLabeled provide additional expert mode functions that may be used to directly import data as OmicsObject variables without a graphical interface.

OataImporter[associationName]		nterface to extract data and create an OmicsOb- Name for associations of information.
OmicsObjectCreator[outerLabels, innerLabels, measurements,metadata]	creates an OmicsObjectinputs:	ct for use with MathIOmica. It uses the following
,	outerLabels	Outer labels (keys) for the OmicsObject.
	innerLabels	Inner labels (keys) for identifiers in the OmicsObject.
	measurements	List of measurements for each inner label.
	metadata	List of metadata for each label.
positionsList, fileList, headerLines]	originally created for	DataImporter.
	OmicsObject importin	[positionsList, fileList, headerLines] creates an g the column number in positionsList from the and importing data by skipping a number of

Working with OmicsObject Data

An OmicsObject is an association of associations, and so Query can be used directly to access and manipulate components. MathIOmica also offers multiple functions that can implement computations and manipulation of an OmicsObject:

Applier[function, inputData]	applies function to OmicsObject, association or list inputData components.
ApplierList[function, inputData]	applies <i>function</i> to list of lists from an association, nested association or components or a matrix <i>inputData</i> .
ConstantAssociator [inputAssociation, associationAddition]	adds multi key constant to an OmicsObject (or an association of associations) <i>inputAssociation</i> , with each addition specified in a single association <i>associationAddition</i> , of form $< addition1 \rightarrow Value1,addition2 \rightarrow Value2, >$.
CreateTimeSeries [dataIn]	creates a time series list across an ${\sf OmicsObject}\ {\it dataIn}\ {\sf using}\ {\sf outer}\ {\sf Keys}$ for points.
EnlargeInnerAssociation [omicsObjectList]	combines a list of OmicsObject (associations of associations) omicsObjectList elements by enlarging the inner associations – inner association Keys must be different.
EnlargeOuterAssociation [omicsObjectList]	combines a list, <i>omicsObjectList</i> , of OmicsObject (or associations of associations) elements to a combined output by enlarging the outer associations – outer association keys must be different.
FilteringFunction [omicsObject, cutoff]	filters an $OmicsObject$ data by a chosen comparison (by default greatr or equal) to a $\it cutoff$.
FilterMissing[omicsObject, percentage]	filters out data from <i>omicsObject</i> if across the datasets a <i>percentage</i> of data points is missing.
<pre>LowValueTag[omicsObject, valueCutoff]</pre>	takes an <i>omicsObject</i> and tags values in specified position as Missing[] based on provided <i>valueCutoff</i> .
<pre>MeasurementApplier [function, omicsObject]</pre>	applies a <i>function</i> to the measurement list of an <i>omicsObject</i> , ignoring missing values.
Returner [original Association, update]	returns a modified <i>originalAssociation</i> updated at a specified position by the single association <i>update</i> , e.g. from Applier or ApplierList result.
Constitute for an arise than Online Ohio to the beauty	

Functions for manipuling OmicsObject datasets.

Example Data

MathIOmica comes with multiple example data. The data can be found in the ConstantMathIOmicaExamplesDirectory:

We can get a listing of the current example Data by evaluating:

In[3]:= FileNames[__, ConstantMathIOmicaExamplesDirectory]

The data contains both initial (raw) data and additionally intermediate data that have been analyzed in MathIOmica and are used in the examples (**N.B.** these files should **not** be altered or removed). The dynamic raw datasets are from an integrative Personal Omics Profile as described below:

integrative Personal Omics Profiling (iPOP)

Data from the first integrative Omics Profiling (iPOP) is used comprised of dynamics from proteomics transcriptomics and metabolomics. The data corresponds to a time series analysis of omics from blood components from a single individual.

Different samples (from 7 to 21 included here) were obtained at different time points. The time points included here correspond to days ranging from 186th to the 400th day of the study, (this can be represented in the following sample to day association: $<\!|\,7\!\rightarrow\!186\,, 8\!\rightarrow\!255\,, 9\!\rightarrow\!289\,, 10\!\rightarrow\!290\,, 11\!\rightarrow\!292\,, 12\!\rightarrow\!294\,, 13\!\rightarrow\!297\,, 14\!\rightarrow\!301\,, 15\!\rightarrow\!307\,, 16\!\rightarrow\!311\,, 17\!\rightarrow\!322\,, 18\!\rightarrow\!329\,, 19\!\rightarrow\!369\,, 20\!\rightarrow\!380\,, 21\!\rightarrow\!400\,|\,>$. On day 289 the subject of the study had a Respiratory syncytial virus infection. Additionally, after day 301, the subject displayed high glucose levels and was eventually diagnosed with type 2 diabetes. The analyzed mapped data are used in

Example iPOP Set Description

iPOP Transcriptome. The transcriptomic data included was obtained from mapping of the originally RNA Sequencing raw data using the Tuxedo suite. The data corresponds to transcriptome from peripheral blood mononuclear cells (PBMCs).

iPOP Proteome. The Proteomics
 data from analysis of mass
 spectrometry data using the
 Sequest algorithm implemented
 by ProteomeDiscoverer. The data
 corresponds to proteome from PBMCs.

The names of the files provide a correspondce of samples to Tandem Mass Tag labels in order of increasing m/z values from 126 to 131 amu. 6 TMT labels were used in each experiment. The data has been adapted from the

original to UniProt accessions.

iPOP Metabolome. The Metabolomics
 data from analysis of mass
 spectrometry data. The data
 corresponds to small molecule
 metabolomics from plasma ran
 with technical triplicates.

The names of the files provide a correspondce of samples ran in positive or negative mode.

File Names located in the ConstantMathIOmicaExamplesDirectory.

Transcriptome Data

In this section we import the example transcriptome iPOP dataset, and illustrate a preprocessing approach for this omic dataset.

Importing OmicsObject Transcriptome Data

We first import the transcriptomics data example (for details on how to import such data please refer to DataImporter, DataImporterDirect, DataImporterDirectLabeled and OmicsObjectCreator documentation).

We import the transcriptomics OmicsObject

```
In[4]:= \begin{tabular}{ll} $$ rnaExample = Get[FileNameJoin[{ConstantMathIOmicaExamplesDirectory, "rnaExample"}]]$ \\ \hline & (|7 \rightarrow <| \{FAM138A, RNA\} \rightarrow \{\{0\}, \{0K\}\}, \{0R4F5, RNA\} \rightarrow \{\{0\}, \{0K\}\}, \{10C729737, RNA\} \rightarrow \{\{2.73998\}, \{0K\}\}, (0.25262..., \{10C100507412, RNA\} \rightarrow \{\{0\}, \{0K\}\}, \{10E14] = \{10E14555, RNA\} \rightarrow \{\{0\}, \{0K\}\}, \{10E14555, RNA\} \rightarrow \{\{0\},
```

There are multiple samples given by the outer associations. We can use Query to get any data. For example we can get the outer keys:

```
In[5]:= Query[Keys]@rnaExample
Out[5]= {7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21}
```

Notice that we have used "@" to form a Query using a prefix function application, which is used throughout the MathIOmica tutorials and documentation. This is the same as using the [] form:

```
In[6]:= Query[Keys][rnaExample]
Out[6]= {7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21}
```

We can get the expression raw data from any sample and entry. For example, the 10th and 14th entries in sample 12:

```
\label{eq:local_local_local_local_local} $$In[7]:= \mathbb{Q}_{12}, {7777, 55}]@rnaExample $$Out[7]= <| {NDNL2, RNA} \to {\{21.1197\}, {OK}}, {ATAD3C, RNA} \to {\{0.560212\}, {OK}}| > $$ATAD3C, RNA} \to {\{0.560212\}, {OK}}| > $$ATAD3C, RNA} \to {\{0.560212\}, {OK}}| > $$ATAD3C, RNA} \to {\{0.560212\}, {OK}}| > $$$ATAD3C, RNA} \to {\{0.560212\}, {OK}}| > $$$$ATAD3C, RNA} \to {\{0.560212\}, {OK}}| > $$$$ATAD3C, RNA} \to {\{0.560212\}, {OK}}| > $$$$$ATAD3C, RNA} \to {\{0.560212\}, {OK}}|
```

The keys correspond to "Gene Symbols" and are also tagged with an "RNA" label. The values of all the keys/IDs correspond to {{measurements}, {metadata}}, and in this particular example {{"FPKM" values}, {"FPKM status"}}. Here, FPKM stands for Fragments Per Kilobase of transcript per Million mapped reads. The example is from mapped RNA-Sequencing data. FPKM is then a relative measure of transcript (gene) expression.

We can query all timepoints for a particular gene of interest if it exists. We must use the same labels as the actual keys of the OmicsObject:

```
\label{eq:local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_local_
```

We note that we added Key@ before the bracket to indicate that this list is used as a key for the inner associations.

We can query all timepoints for multiple genes of interest if it exists. We must use the same labels as the actual keys of the OmicsObject:

```
In[9]:= Query[All, {Key@{"NFKBIB", "RNA"}, Key@{"NDNL2", "RNA"}}]@rnaExample
Out[9] = \langle |7 \rightarrow \langle | \{NFKBIB, RNA\} \rightarrow \{\{12.7644\}, \{OK\}\}, \{NDNL2, RNA\} \rightarrow \{\{13.6201\}, \{OK\}\} \} \rangle
                                          8 \rightarrow \  \, \langle \, | \, \, \{\text{NFKBIB}, \, \, \text{RNA}\} \rightarrow \{\, \{14.9997\} \,, \, \, \{\text{OK}\} \,\} \,, \, \, \{\text{NDNL2}, \, \, \text{RNA}\} \rightarrow \{\, \{16.3813\} \,, \, \, \{\text{OK}\} \,\} \, \, | \, \rangle \,,
                                          9 \rightarrow \langle | \; \{ \text{NFKBIB}, \; \text{RNA} \} \rightarrow \{ \; \{ \text{15.8482} \} \;, \; \{ \text{OK} \} \; \} \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \rightarrow \{ \; \{ \text{16.2763} \} \;, \; \{ \text{OK} \} \; \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \rightarrow \{ \; \{ \text{16.2763} \} \;, \; \{ \text{OK} \} \; \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \rightarrow \{ \; \{ \text{16.2763} \} \;, \; \{ \text{OK} \} \; \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \rightarrow \{ \; \{ \text{16.2763} \} \;, \; \{ \text{OK} \} \; \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \rightarrow \{ \; \{ \text{16.2763} \} \;, \; \{ \text{OK} \} \; \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \; | \rangle \;, \; \{ \text{NDNL2}, \; \text{RNA} \} \;, \; \{ \text{NDNL2}, \; \text{R
                                           \textbf{11} \rightarrow \  \langle | \  \{ \text{NFKBIB}, \ \text{RNA} \} \rightarrow \  \{ \  \{ 18.5309 \} \,, \ \ \{ \text{OK} \} \} \,, \ \ \{ \text{NDNL2}, \ \text{RNA} \} \rightarrow \  \{ \  \{ 18.3254 \} \,, \ \ \{ \text{OK} \} \} \mid \rangle \,,

```

We should also note that we can take advantage of Mathematica's native direct access to Wolfram Alpha, to look up any "Gene Symbol" information by evaluating (needs a network connection):

Here is an image of the output:

WolframAlpha 🕒

Processing Transcriptome Mapped Data

We will next preprocess the imported transcriptome data. We will first relabel the data, carry out quantile normalization and filtering and we will finally create time series.

Labeling, Normalization and Filtering

Re-labeling Samples with Times

First, we illustrate how to change the outer keys. In this example, we notice that the sample numberings do not correspond to actual days, so we may want to adjust the outer keys to correspond to real times.

We form an association between samples to actual days of the study:

```
In[12]:= sampleToDays =
           <|"7" → "186", "8" → "255", "9" → "289", "10" → "290", "11" → "292", "12" → "294", "13" → "297", "14" → "301",</p>
            "15" → "307", "16" → "311", "17" → "322", "18" → "329", "19" → "369", "20" → "380", "21" → "400"|>;
```

We can now do a KeyMap to rename the outer keys:

In[13]:= rnaLongitudinal = KeyMap[sampleToDays, rnaExample]

```
\langle | 186 \rightarrow \langle | \{FAM138A, RNA\} \rightarrow \{ \{0\}, \{0K\} \}, 
                                        \{OR4F5, RNA\} \rightarrow \{\{0\}, \{OK\}\}, \{LOC729737, RNA\} \rightarrow \{\{2.73998\}, \{OK\}\}, \dots 25262\dots\}
                                              \{ \texttt{LOC100507412}, \; \texttt{RNA} \} \rightarrow \{ \{ \texttt{0} \}, \; \{ \texttt{OK} \} \}, \; \{ \texttt{RNA45S5}, \; \texttt{RNA} \} \rightarrow \{ \{ \texttt{0} \}, \; \{ \texttt{OKAL}, \; \texttt{RNA} \} \rightarrow \{ \{ \texttt{0} \}, \; \{ \texttt{OK} \} \} \}, \; \{ \texttt{NNA} \} \rightarrow \{ \{ \texttt{0} \}, \; \{ \texttt{OK} \} \} \}, \; \{ \texttt{NNA} \} \rightarrow \{ \{ \texttt{0} \}, \; \{ \texttt{OK} \} \} \}, \; \{ \texttt{NNA} \} \rightarrow \{ \{ \texttt{0} \}, \; \{ \texttt{OK} \} \}, \; \{ \texttt{NNA} \} \rightarrow \{ \{ \texttt{0} \}, \; \{ \texttt{OK} \} \}, \; \{ \texttt{NNA} \} \rightarrow \{ \{ \texttt{0} \}, \; \{ \texttt{OK} \} \}, \; \{ \texttt{NNA} \}, \; \{ \texttt{NNA} \}, \; \{ \texttt{OK} \}, \; \{ \texttt{NNA} \}, \; \{ \texttt{OK} \}, \; \{ \texttt{NNA} \}, \; \{ \texttt{NNA}

```

Quantile Normalization

```
QuantileNormalization [data]
                                               performs quantile normalization of data.
```

QuantileNormalization can perform quantile normalization across various samples for multiple forms of data, including OmicsObject and matrix data.

We normalize the transcriptome data using the QuantileNormalization function.

```
In[14]:= rnaQuantileNormed = QuantileNormalization[rnaLongitudinal]

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    show more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           show all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 set size limit...
```

Tag Missing and Low Values

Next, we will tag values of less than 1 FPKM as Missing. Additionally, we will treat values of FPKM less than 5 as "noise" and set them all to a token value of 1.

```
takes an omicsObject and tags values in specified position as Missing[]
LowValueTag[omicsObject, valueCutoff]
                                                 based on provided valueCutoff.
```

LowValueTag allows us to tag low values.

option name	default value	
ComponentIndex	1	Selection of which component of a list to use in the association or OmicsObject input values.
ListIndex	1	Selection of which list to use in the association or OmicsObject input values.
OtherReplacement	_Missing :> Missing[]	Replacement rule for any other kind of replacement in the data.
ValueReplacement	Missing[]	Value that specifies how tagged data points will be replaced.

Options for LowValueTag.

We first use LowValueTag to tag values of 0 as Missing[]:

In[15]:= rnaZeroTagged = LowValueTag[rnaQuantileNormed, 0]

```
< | 186 \rightarrow < | \{FAM138A, RNA\} \rightarrow \{\{Missing[]\}, \{OK\}\}, \}
                                              \{\text{OR4F5, RNA}\} \rightarrow \{\{\text{Missing[]}\}, \{\text{OK}\}\}, \{\text{LOC729737, RNA}\} \rightarrow \{\{\text{2.73998}\}, \{\text{OK}\}\}, \dots 25263\dots\}, \{\text{CNA}\}\}
                                                \{\texttt{RNA45S5},\, \texttt{RNA}\} \rightarrow \{\{\texttt{Missing[]}\},\, \{\texttt{OK}\}\},\, \{\texttt{DUX4L},\, \texttt{RNA}\} \rightarrow \{\{\texttt{Missing[]}\},\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{DUX4L},\, \texttt{RNA}\} \rightarrow \{\{\texttt{Missing[]}\},\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{DUX4L},\, \texttt{RNA}\} \rightarrow \{\{\texttt{Missing[]}\},\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{DUX4L},\, \texttt{RNA}\} \rightarrow \{\{\texttt{Missing[]}\},\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{DUX4L},\, \texttt{RNA}\} \rightarrow \{\{\texttt{Missing[]}\},\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{Missing[]}\},\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{Missing[]}\} \mid \{\texttt{Missing[]}\},\, \{\texttt{OK}\}\} \mid \rangle,\, \{\texttt{Missing[]}\} \mid \{\texttt{M
            255 \rightarrow \langle | \cdots 1 \cdots | \rangle \text{, } \cdots 11 \cdots \text{, } 380 \rightarrow \langle | \cdots 1 \cdots | \rangle \text{, } 400 \rightarrow \langle | \cdots 1 \cdots | \rangle \text{, } \rangle
                                                                                                                                                              show less
                                                                                                                                                                                                                                                                                                                show more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            show all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             set size limit...
large output
```

We next use LowValueTag again to set all FPKM values <1 to unity:

```
In[16]:= rnaNoiseAdjusted = LowValueTag[rnaZeroTagged, 1, ValueReplacement → 1]
```

```
< \mid 186 \rightarrow < \mid \{ \texttt{FAM138A, RNA} \} \rightarrow \{ \{ \texttt{Missing[]} \} \text{, } \{ \texttt{OK} \} \} \text{,}
                                 \{OR4F5, RNA\} \rightarrow \{\{Missing[]\}, \{OK\}\}, \{LOC729737, RNA\} \rightarrow \{\{2.73998\}, \{OK\}\}, \dots 25263\dots, \{DRAF5, RNA\} \rightarrow \{\{AMSSING[]\}, \{OMS\}\}, \{OMSSING[]\}, \{OMSSING[]\},
                                  \{\texttt{RNA45S5}, \ \texttt{RNA}\} \rightarrow \{\{\texttt{Missing[]}\}, \ \{\texttt{OK}\}\}, \ \{\texttt{DUX4L}, \ \texttt{RNA}\} \rightarrow \{\{\texttt{Missing[]}\}, \ \{\texttt{OK}\}\} \mid \rangle, \}
          255 \rightarrow \langle | \cdots 1 \cdots | \rangle, | \cdots 11 \cdots \rangle, 380 \rightarrow \langle | \cdots 1 \cdots | \rangle, 400 \rightarrow \langle | \cdots 1 \cdots | \rangle | \rangle
                                                                                                                   show less
                                                                                                                                                                                                                          show more
                                                                                                                                                                                                                                                                                                                                          show all
                                                                                                                                                                                                                                                                                                                                                                                                                                       set size limit...
large output
```

Filter Data

We will next remove values that have been tagged as Missing[], retaining data that have at least 3/4 data points available across all samples. Here we use the function FilterMissing:

```
FilterMissing[omicsObject, percentage]
                                                  filters out data from omicsObject, retaining data across the datasets with
                                                  a percentage of data points not missing.
```

FilterMissing allows the removal of data marked as Missing[], and retains only data with measurements available for a certain percentage of samples.

option name	default valu	e
MininumPoints	3	Minimum number of datapoints to keep.
Reference	{}	Select a reference outer key for which should remove dataset if the reference point has a Missing value.
ShowPlots	True	Whether to show summary plots.

Options for FilterMissing.

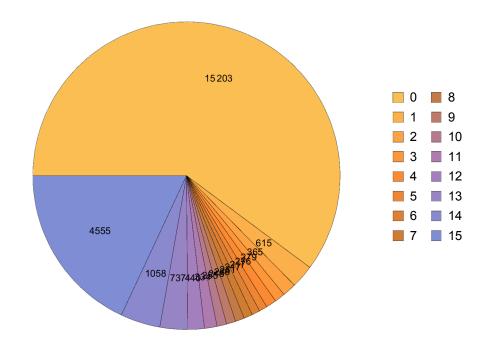

In this dataset we will use a reference point, day "255" which was a healthy measurement.

Hence, we filter out data where the reference point "255" is missing and retain data with at least 3/4 poings available:

In[17]:= rnaFiltered = FilterMissing[rnaNoiseAdjusted, 3/4, Reference → "255"]

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   set size limit...
```

Create Transcriptome Time Series

We can now create time series for each of the genes. MathIOmica provides functions to facilitate the process, such as CreateTimeSeries and TimeExtractor. The functions assume an OmicsObject as an input for which times have been used as the sample labels (outer keys).

CreateTimeSeries[omicsObject]

creates a time series list across an OmicsObject using outer keys as

times.

TimeExtractor [omicsObject]

extracts a list of sorted times from an OmicObject's outer keys.

We extract the times for the filtered RNA data using TimeExtractor:

```
In[18]:= timesRNA = TimeExtractor[rnaFiltered]
Out[18] = \{186, 255, 289, 290, 292, 294, 297, 301, 307, 311, 322, 329, 369, 380, 400\}
```

For each gene we now extract a time series (list of values) corresponding to these times:

In[19]:= timeSeriesRNA = CreateTimeSeries[rnaFiltered]

```
\langle | \{ LOC729737, RNA \} \rightarrow \{ 2.73998, 1, 5.15563, 4.53362, \} \rangle
               5.71829, 1, 1.413, 2.38838, 1, 1, 2.2049, 2.18935, 4.05165, 2.70102, 1.22675},
             \cdots 16 460 \cdots , {UTY, RNA} \rightarrow {3.16532, 3.28427, 3.06644, 1.77757, 2.90109, 2.48543,
Out[19]=
                2.49979, 2.65107, 1, 2.24661, 1.49351, 1.56608, 1.59413, 1.13702, 1} |>
                          show less
                                       show more
                                                      show all
                                                                  set size limit...
           large output
```

Take Log Ratios Compared to Reference in Transcriptome Time Series

Next, we want to use log ratios of expression at any time point compared to a healthy datapoint.

SeriesApplier [function,data]

applies a given function to data, an association of lists, implementing masking for Missing values.

Applying a function to a series with Missing data.

We first use SeriesApplier to implement the logarithm:

```
In[20]:= timeSeriesRNALog = SeriesApplier[Log, timeSeriesRNA]
```

```
\label{eq:loc729737} \\ \text{(INCCOMP} \\ \text{(IN
                                              0.790682, \ 0.783605, \ 1.39912, \ 0.993629, \ 0.204368 \}, \ \cdots \ 16\ 460 \cdots , \ \{UTY, \ RNA\} \rightarrow \{ \cdots \ 1 \cdots \ \} \mid >1 \rangle 
large output
                                                                                                                                                                     show less
                                                                                                                                                                                                                                                                                                                        show more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           show all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             set size limit...
```

Now we need to compare to use log ratios of expression at any time point compared to a healthy datapoint. We can use the function SeriesInternalCompare:

SeriesInternalCompare [associationOfLists]

compares each value in each list of associationOfLists to an internal reference value in the list, if the reference point itself is not Missing.

Comparing values in a series to an internal reference point in the series.

option name	default value	
CompareFunction	(If[MatchQ[Head[#2], Missing], Missing[], (#1- #2)]&)	The function is used by a Query operation on non-missing input data. Namely: Query[All, CompareFunction[#,#[[ComparisonIndex]]]&]@
ComparisonIndex	1	List position of list value that will be used as a reference data point.
DeleteRule	{Head, Missing}	DeleteRule allows the customization of how to select values for the reference data point for which its key should be deleted. The DeleteRule value takes the structure deleteRuleOptionValue = {MatchQ first argument, MatchQ second argument} The MatchQ function referred to here is implemented by SeriesInternalCompare internally, and uses the deleteRuleOptionValue as: MatchQ[deleteRuleOptionValue[[1]][reference comparison value], deleteRuleOptionValue[[2]]] The default removes the corresponding key if the value used for reference in the comparison is actually Missing, i.e. the comparison reference point has Head that matches Missing.

 ${\tt Options} \ {\tt for} \ {\tt SeriesInternalCompare} \ .$

We compare every value in each series to the healthy "255" time point, which is the second element in each series:

```
In[21]:= rnaCompared = SeriesInternalCompare[timeSeriesRNALog, ComparisonIndex \rightarrow 2]
```

```

                                                                                                                                                                      show less
                                                                                                                                                                                                                                                                                                                               show more
```

ConstantSeriesClean [dataIn]

removes constant list series from an association of lists.

Removing constant series.

Finally, we use ConstantSeriesClean to remove constant series, as we are interested in changing time patterns:

In[23]:= rnaFinalTimeSeries = ConstantSeriesClean[normedRNACompared]

Removed series and returning filtered list. If you would like a list of removed keys run the command ConstantSeriesClean[data,ReturnDropped → True].

```
large output
   show less
      show more
         show all
            set size limit...
```

Resampling Transcriptome Data

In addition to the above, we want to create a resampled distribution for the transcriptome dataset prior to classification and clustering. In this subsection we first resample the imported and labeled transcriptome dataset, Then, we carry out the full analysis in this "bootstrap" dataset, to create a set of random time series. This bootstrap distribution of time series will be used to provide the cutoffs used in the time series classification in the following subsection.

Resampling the Transcriptome Data

First, we use BootstrapGeneral:

```
BootstrapGeneral[
  omicsObject, numberResampled]
```

performs a resampling of the omicsObject data with replacement, and generates a new association structure with numbering corresponding to the *numberResampled* of new identities.

We can perform resampling of an OmicsObject to create a bootstrap dataset to be used for statistical considerations.

We create a resampling of 100000 sets:

```
In[24]:= rnaBootstrap = BootstrapGeneral[rnaLongitudinal, 100 000]
                                                                                                                                                \langle | 186 \rightarrow \langle | 1 \rightarrow \{ \{6.26661\}, \{0K\} \}, 2 \rightarrow \{ \{13.292\}, \{0K\} \}, 3 \rightarrow \{ \{11.8179\}, \{0K\} \}, \{0K\} \} \}

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   set size limit...
                                                                                                                                             large output
```

Processing the Bootstrap Transcriptome and Creating Bootstrap Time Series

```
We normalize the transcriptome bootstrap data using the QuantileNormalization function:
```

```
In[25]:= rnaBootstrapQuantileNormed = QuantileNormalization[rnaBootstrap];
```

We use LowValueTag to tag zero values as Missing[]:

In[26]:= rnaBootstrapZeroTagged = LowValueTag[rnaBootstrapQuantileNormed, 0];

We next use LowValueTag again to set all FPKM values <1 to unity:

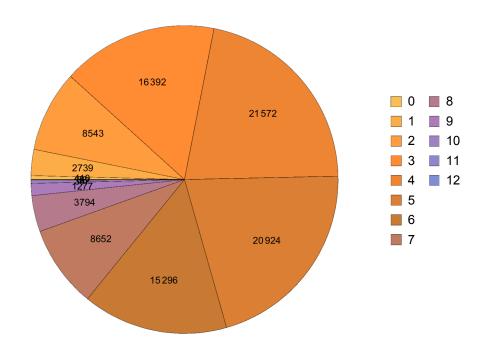

In[27]:= rnaBootstrapNoiseAdjusted = LowValueTag[rnaBootstrapZeroTagged, 1, ValueReplacement → 1];

Next, we filter out data where the reference point "255" is missing and retain data with at least 3/4 poings available:

In[28]:= rnaBootstrapFiltered = FilterMissing[rnaBootstrapNoiseAdjusted, 3/4, Reference ightarrow "255"]

Number of Missing Data Points per Component Counts 20 000 15000 10 000 5000 --- Number of Missing Points {Missing -> Counts: $, \langle |0 \rightarrow 410, 1 \rightarrow 2739, 2 \rightarrow 8543, 3 \rightarrow 16392, 4 \rightarrow 21572,$ $5 \rightarrow 20\,924,\ 6 \rightarrow 15\,296,\ 7 \rightarrow 8652,\ 8 \rightarrow 3794,\ 9 \rightarrow 1277,\ 10 \rightarrow 337,\ 11 \rightarrow 56,\ 12 \rightarrow 8 \mid > \}$

Pie Chart of number of missing components

```
\langle |186 \rightarrow \langle |1 \rightarrow \{\{6.26661\}, \{0K\}\}, 2 \rightarrow \{\{13.292\}, \{0K\}\}, 3 \rightarrow \{\{11.8179\}, \{0K\}\}, 7 \rightarrow \{\{1\}, \{0K\}\}\}, \{0K\}\}
                 9 \rightarrow \{\{12.33\},\ \{0K\}\}\,,\ \underbrace{-28074\cdots},\ 99\ 990 \rightarrow \{\{Missing[]\},\ \{0K\}\}\,,\ 99\ 994 \rightarrow \{\{38.785\},\ \{0K\}\}\,,\ \{0K\}\}\,,
Out[28]=
                 large output
                            show less
                                           show more
                                                           show all
                                                                        set size limit...
```

For each bootstrap member we now extract a time series (list of values) corresponding to the series times:

In[29]:= timeSeriesBootstrapRNA = CreateTimeSeries[rnaBootstrapFiltered]

```
\langle | 1 \rightarrow \{6.26661, 57.0833, 22.2908, 1, Missing[], 1, 1, 1, \}
  41.6445, Missing[], 6.14077, 1, 1, Missing[], 3.33812, 11.3984}, ... 28082...
large output
         show less
                  show more
                           show all
                                   set size limit...
```

We use SeriesApplier to implement a logarithm:

Inf301:= timeSeriesBootstrapRNALog = SeriesApplier[Log, timeSeriesBootstrapRNA]

```
\langle | 1 \rightarrow \{1.83524, 4.04451, 3.10417, 0, Missing[], \}
    0, 0, 3.72917, Missing[], 1.81495, 0, 0, Missing[], 1.20541, 2.43347},
 \cdots 28 082 \cdots , 100 000 \rightarrow {0, 0, 1.95033, 0, Missing[], \cdots 5 \cdots , 2.58773, 0, 0, 0, 0, 0} |>
               show less
                             show more
                                            show all
                                                         set size limit...
large output
```

We compare every value in each series to the healthy "255" time point, which is the second element in each series:

In[31]:= rnaBootstrapCompared = SeriesInternalCompare[timeSeriesBootstrapRNALog, ComparisonIndex \rightarrow 2]

```
-2.22956, -4.04451, -4.04451, Missing[], -2.8391, -1.61104}, -2.3607..., 100000 \rightarrow -1.1...
large output
        show less
                              set size limit...
               show more
                        show all
```

Next, we normalize each series, using again SeriesApplier:

In(32):= normedBootstrapRNACompared = SeriesApplier[Normalize, rnaBootstrapCompared]

```

Classification of Transcriptome Time Series

In this subsection we will classify the transcriptome time series based on patterns in the series. For the classification we will use TimeSeriesClassification.

TimeSeriesClassification [data, setTimes]

takes a data association (or list of lists) of values corresponding to intensities collected over time and classifies the values into classes (groups) that show distinct similar temporal patterns.

TimeSeriesClassification takes as inputs:

Association with series as values, or a list data

of series, where the series contain information regarding time intensities/observations. Each series may include Missing data points and may be entered as list of N signal intensities corresponding one-to-

one to the N setTimes with Missing inserted appropriately if the data is

absent,

 $\{\,X_1 \!=\! X \ (\, \textbf{t}_1\,) \ \textbf{,} X_2 \!=\! X \ (\, \textbf{t}_2\,) \ \textbf{,} \dots \textbf{,} X_N \!=\! X \ (\, \textbf{t}_N\,) \,\,\} \,.$ Alternatively, each series data may be a list of pairs of values $\{\{t_1,X_1\},\{t_2,X_2\},...\}$

... $\{t_N, X_N\}$ for only existing measurements.

A global complete set of all possible N times during which all data series could have been collected in the window of the experiment, including times for which no values were reported or are missing,

 $\{t_1, t_2, \ldots, t_N\}.$

Classifying a set of time series based on temporal behavior.

{ 0 }	Cutoffs for "Autocorrelation" and
	Cutoffs, for "Autocorrelation" and "Interpolated Autocorrelation" methods, for different lags that will be used to filter out data series for which the lags are not within cutoffs. The list length corresponds to cuttofs at different lags, with the ith lag cutoff provided as the ith index, i.e. $ \rho_c = \{\rho_{c1}, \rho_{c2}, \dots, \rho_{ci}, \dots, \rho_{jk}\} \text{ up to k, where } 1 \leq k \leq n, \text{ and typically } n = \text{Floor}\left[\text{Length}\left[\text{setTimes}\right]/2\right]. $ The classification will only consider lags up to the length of the list provided. The cutoffs are userprovided and typically calculated through simulation
False	Option to return the autocorrelation logic list for each signal, with the default set to False. If set to True, a logic vector is returned indicating whether on the autocorrelation for a signal is above or below the AutocorrelationCutoffs.
$ \begin{cases} UpperFrequencyFact- \\ or \\ & \rightarrow & 1 \end{cases} $	- Options that are used by the internal Autocorrelation function in the case that the Method → "Autocorrelation" is set.
"Auto"	Time step used to grid the time window over which calculations will be performed. If set to "Auto" the step will correspond to dividing the span of the interval into a number of equal steps equal to the number of input time points.
	$egin{array}{l} egin{cases} ext{UpperFrequencyFactor} \ ext{or} \ & ext{} \to & 1 \ \end{pmatrix}$

setTimes

InterpolationOptions	{}	Options list for the internal Interpolation function used to interpolate between data points that have Missing values or uneven spacing.
LombScargleCutoff	0	Cutoff value for "LombScargle" method, for filtering the highest intensity observed in the power spectrum. The cutoff is user–provided and typically calculated through simulation.
LombScargleOptions	{PairReturn→ False, NormalizeIntensi- ties→ True}	Options that are used by the internal LombScargle function if the case that the Method \rightarrow "LombScargle" is set.
Method	"LombScargle"	Selection of which algorithm to use in the classification scheme.
ReturnAllSpikes	False	Option whether each signal may maintain unique membership to each spike class, or be allowed to belong to multiple classes. Used in "Autocorrelation" and "InterpolatedAutocorrelation" methods. If set to False, first spike maxima are classified, and only signals found not to belong to spike maxima are then considered for membership in the spike minima class.
ReturnData	True	If set to True will return input keys to data associations in the classification. If set to False will only return the keys of the input data in the classification.
ReturnModels	False	Whether to return the models as well as the classification information for the input data. The data is returned as an association with the key "TimeSeriesClasses" for classification groups and one of the following: (i) "Models" for model-based methods, (ii) "LombScargle" for periodograms in the "LombScargle" method, (iii) "Autocorrelations" for autocorrelation based methods.
SpikeCutoffs	< 1 →{.99,-99}, 2 → {.99,-99} >	Association with number, n, of data points as keys, and values corresponding to cutoffs, in the form < n→ {Maximum Spike Cutoffn, used to call Minimum Spike Cutoffn} > spike maxima and minima for a time series with this number of datapoints. The values are provided by the user depending on data approach based on simulation. The default values are only place—holders and should be replaced by real values. The association must have corresponding keys for all lengths of input datasets, so that Keys[OptionValue[SpikeCutoffs]] ∈ , i.e. all {Possible lengths of numeric data}. possible lengths of series constructed by excluding Missing or other non-numeric values).

${\color{blue} \textbf{Options for TimeSeriesClassification}}.$

TimeSeriesClassification uses multiple methods to classify data. The periodogram/autocorrelation methods used use cutoffs from simulation/user-provided values, to assess class membership based on statistical significance. In this tutorial we will use the "LombScargle" method, to classify data based on a Lomb-Scargle computation of a periodogram. The data is classified based into classes major (highest intensity) frequencies based on the generated periodogram for a signal, when the intensity of this frequency is above an intensity threshold cutoff. Additionally, data that displays spikey behavior in the real intensity, that is not classified into any frequency classes, is classified as a SpikeMaximum or SpikeMinimum if the spike is higer or lower respectively than what one would expect from a random signal.

Method	Description
"LombScargle"	Classification based on periodograms (power spectra) generated by a Lomb-Scargle computation as implemented internally by the LombScargle function. The data is classified into classes of major (highest intensity) frequencies and spikes (maxima or minima in real signal intensity), depending on cutoffs typically provided by simulation and passed to the function by the LombScargleCutoffs and SpikeCutoffs option values. The returned {computed classification vector} for this method is the intensity list of the periodogram for each signal.
"Autocorrelation"	Classification based on autocorrelations generated by a Lomb-Scargle approach using an inverser Fourier transform of spectral intensities, as implemented through the Autocorrelation function. The data is classified into autocorrelations at different lags and spikes (maxima or minima) classes, depending on cutoffs typically provided by simulation. The returned {computed classification vector} for this method is the autocorrelation list for each signal.
"InterpolatedAutocorrelation"	Classification based on autocorrelations generated directly in time, with Missing data handled through interpolation. The data is classified into autocorrelations at different lags and spikes (maxima or minima) classes depending on cutoffs typically provided by simulation. The returned {computed classification vector} for this method is the autocorrelation list for each signal.
"TimeSeriesModelAggregate"	Classification based on model fitting of time series through TimeSeriesModelFit and all available models therein. The data is classified into aggregate model classes. The returned {computed classification vector} for this method is the actual input signal.
"TimeSeriesModelDetailed"	Classification based on model fitting of time series through TimeSeriesModelFit and all available models therein. The data is classified into model classes based on individual model degree parameters. The returned {computed classification vector} for this method is the "BestFitParameters" for the model fit. If this list is empty an integer list is returned {token integer} – this is used in subsequent clustering applications.

${\tt Methods} \ for \ {\tt TimeSeriesClassification} \ .$

To create the cutoffs for the classification we will first use the bootstrap time series set created in the previous subsection, and ${\tt QuantileEstimator}$.

QuantileEstimator [data, timepoints]	obtains the quantile estimator following bootstrap for time series. It takes as inputs:	
	data	Association or list with series as values,
		from which to generate a distribution.
	timepoints	Timepoints over which the time series run.

Estimating the quantile value that can be used as a cutoff for classification of time series based on bootstrap simulations.

option name	default value	
AutocorrelationOptions	{}	Specific options when calculating autocorrelations for the time series.
InterpolationDeltaT	"Auto"	Time step used to grid the time window over which calculations will be performed. If set to "Auto" the step will correspond to dividing the span of the interval into a number of equal steps equal to the number of input time points.
InterpolationOptions	{}	Options list for the internal Interpolation function used to interpolate between data points that have Missing values or uneven spacing.
LombScargleOptions	{PairReturn → False, NormalizeIntensi-ties→ True}	Specific options when calculating LombScargle periodograms for the time series.
Method	"LombScargle"	Method of calculation. Choices include one of the following: {"LombScargle","Autocorrelation", "InterpolatedAutocorrelation","Spikes"}
QuantileValue	0.95	Which quantile to extract.

${\color{blue} \textbf{Options for QuantileEstimator}}\;.$

Depending on the cutoffs we would like to generate, we select the appropriate Method (also considering the Method that the downstream TimeSeriesClassification will use).

Method	Description
"Autocorrelation"	List of values corresponding to selected quantile of autocorrelations, with the ith lag quantile provided as the ith index, i.e. $\rho_c = \{\rho_{c1}, \rho_{c2}, \dots, \rho_{ci}, \dots, \rho_{ck}\} \text{ up to k lags, where } 1 \leq k \leq n, \text{ and typically } n = \text{Floor}[\text{Length}[\text{timepoints}]/2]. The method utilizes the Autocorrelation function internally.}$
"InterpolatedAutocorrelation"	List of values corresponding to selected quantile for autocorrelations, with the ith lag quantile provided as the ith index, i.e. $\rho_c = \{\rho_{c1}, \rho_{c2}, \dots, \rho_{ci}, \dots, \rho_{ck}\} \text{ up to k lags, where } 1 \leq k \leq n, \text{ and typically } n = (\text{Length[timepoints]}-1). The method utilizes an Interpolation followed by a CorrelationFunction implementation to compute autocorrelations, i.e. missing data or uneven sampling is handled by data interpolation.$
"LombScargle"	Single value corresponding to selected quantile of maximum peak intensity of periodogram. The method utilizes the LombScargle function internally.
"Spikes"	Association with number, n, of data points as keys, and values corresponding to quantiles for maxima and minima of the series, in the form $<\mid n \rightarrow \{\text{Maximum Spike Quantile}_n, \text{Minimum Spike Quantile}_n\}\mid>.$ The keys are generated automatically so that so that Keys[output] $\in \{\text{Possible lengths of numeric data}\}$. , i.e. all possible lengths of input series constructed by excluding Missing or other non–numeric values).

 $\label{thm:method_selection} \mbox{Method selection and output for } \mbox{QuantileEstimator} \ .$

The default output for TimeSeriesClassification is an Association with outer keys being the classification classes, inner keys being class members, and each class member value being list of

```
{{computed classification vector}, {input data list}}. The general output structure is for M output classes of each
having m<sub>i</sub> members:
```

```
< | Class_1 \rightarrow < | Member_{11} \rightarrow \{ \{ classification vector_{11} \}, \{ input data vector_{11} \} \},
     \texttt{Member}_{12} \rightarrow \ \{ \{ \texttt{classification} \ \texttt{vector}_{12} \} \,, \ \{ \texttt{input} \ \texttt{data} \ \texttt{vector}_{12} \} \,\} \,, \ \dots,
     Member_{1 m_1} \rightarrow \{\{classification vector_{1 m_1}\}, \{input data vector_{1 m_1}\}\} \mid >, \}
 Class_2 \rightarrow \langle | Member_{21} - \rangle \{ \{ classification vector_{21} \}, \{ input data vector_{21} \} \},
     Member<sub>22</sub> -> {{classification vector<sub>22</sub>}, {input data vector<sub>22</sub>}}, ...,
      Member_{2m_2} \rightarrow \{\{classification vector_{2m_2}\}, \{input data vector_{2m_2}\}\}\} > , \ldots,
  Class_{M} \rightarrow \langle | Member_{M1} - \rangle \{\{classification vector_{M1}\}, \{input data vector_{M1}\}\},
     Member_{M2} \rightarrow \{\{classification vector_{M2}\}\}, \{input data vector_{M2}\}\}, \ldots,
     Member_{Mm_M} \rightarrow \{\{classification vector_{Mm_M}\}, \{input data vector_{Mm_M}\}\} | > | > |
```

Before we classify our transcriptome data, we estimate for the "LombScargle" Method a 0.95 quantile cutoff from the bootstrap transcriptome data:

```
In[34]:= q95RNA = QuantileEstimator [rnaBootstrapFinalTimeSeries, timesRNA]
Out[34]= 0.859043
```

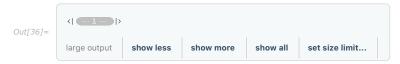

Next, we estimate the "Spikes" 0.95 quantile cutoff from the bootstrap transcriptome data:

```
In[35]:= q95RNASpikes = QuantileEstimator[rnaBootstrapFinalTimeSeries, timesRNA, Method → "Spikes"]
Out[35] = \langle | 12 \rightarrow \{0.821455, -0.445414\}, 13 \rightarrow \{0.803486, -0.427123\}, \rangle
           14 \rightarrow \{0.780647, -0.401738\}, 15 \rightarrow \{0.755499, -0.379251\} \mid >
```

Now we can classify the transcriptome time series data based on these cutoffs:

```
Inf36]:= rnaClassification = TimeSeriesClassification[rnaFinalTimeSeries,
         timesRNA, LombScargleCutoff → q95RNA, SpikeCutoffs → q95RNASpikes]
```

Method → "LombScargle"

The default output for TimeSeriesClassification is an Association with outer keys being the classification classes, inner the class members, and each class member value being {{computed classification vector}, {input data list}}. The general output structure is for M output classes of each having m_i members:

```
< | Class_1 \rightarrow < | Member_{11} \rightarrow \{ \{ classification vector_{11} \}, \{ input data vector_{11} \} \},
      Member_{12} \rightarrow \{\{classification vector_{12}\}, \{input data vector_{12}\}\}, \ldots,
      \text{Member}_{1\,m_1} \rightarrow \ \{ \{ \text{classification vector}_{1\,m_1} \} \,, \, \{ \text{input data vector}_{1\,m_1} \} \} \, | \, > \,,
  Class_2 \rightarrow \langle | Member_{21} - \rangle \{ \{ classification vector_{21} \}, \{ input data vector_{21} \} \},
      Member_{22} \rightarrow \{\{classification vector_{22}\}, \{input data vector_{22}\}\}, \ldots,
      \text{Member}_{2\,m_2} \rightarrow \ \{ \{ \text{classification vector}_{2\,m_2} \} \,, \ \{ \text{input data vector}_{2\,m_2} \} \,\} \,| \, >, \quad \ldots, \\
  \texttt{Class}_{\texttt{M}} \ \rightarrow \ < | \, \texttt{Member}_{\texttt{M1}} \, - > \, \{ \, \{ \, \texttt{classification} \, \, \texttt{vector}_{\texttt{M1}} \} \, , \, \, \{ \, \texttt{input} \, \, \texttt{data} \, \, \texttt{vector}_{\texttt{M1}} \} \, \} \, ,
      Member_{M2} \rightarrow \{\{classification vector_{M2}\}\}, \{input data vector_{M2}\}\}, \ldots,
      Member_{Mm_M} \rightarrow \{\{classification vector_{Mm_M}\}, \{input data vector_{Mm_M}\}\} | > | > |
```

If we want the classes produced, we can query the keys:

```
In[37]:= Keys[rnaClassification]
Out[37]= {SpikeMax, SpikeMin, f1, f2, f3, f4, f5, f6, f7}
```

For the number of members in each class we have:

```
In[38]:= Query[All, Length]@rnaClassification
Out[38] = \langle | SpikeMax \rightarrow 600, SpikeMin \rightarrow 8507, f1 \rightarrow 58, f2 \rightarrow 3, f3 \rightarrow 13, f4 \rightarrow 40, f5 \rightarrow 14, f6 \rightarrow 10, f7 \rightarrow 56 | \rangle
                                                                  We can obtain the membership list in any class of interest:
 In[39]:= Query["f1", Keys]@rnaClassification
 \textit{Out} \texttt{[39]= } \Big\{ \{ \texttt{HPCAL4, RNA} \}, \Big\{ \texttt{C1orf35, RNA} \Big\}, \\ \{ \texttt{EPC1, RNA} \}, \\ \{ \texttt{CCSER2, RNA} \}, \\ \{ \texttt{ARL3, RNA} \}, \\ \{ \texttt{ADD3, RNA} \}, \\ \{ \texttt{PDZD8, RNA} \}, \\ \{ \texttt{PDZB8, RNA} \}, \\ \{ \texttt{PDZ
                                                                             {PVRL1, RNA}, {SORL1, RNA}, {XPOT, RNA}, {UHRF1BP1L, RNA}, {VWA8, RNA}, {KIAA0586, RNA},
                                                                            {SNURF, RNA}, {NEO1, RNA}, {CMIP, RNA}, {CYB5D1, RNA}, {MED1, RNA}, {TSHZ1, RNA}, {ZNF507, RNA},
                                                                             {CENPBD1P1, RNA}, {NCOA1, RNA}, {PNPT1, RNA}, {MARCH7, RNA}, {PLCL1, RNA}, {PRNP, RNA},
                                                                             {XRN2, RNA}, {LOC284801, RNA}, {RPN2, RNA}, {NRIP1, RNA}, {NPTXR, RNA}, {PPARA, RNA},
                                                                             \{ \texttt{COMMD2}, \ \texttt{RNA} \}, \ \{ \texttt{KPNA4}, \ \texttt{RNA} \}, \ \{ \texttt{LRCH3}, \ \texttt{RNA} \}, \ \{ \texttt{SEPT11}, \ \texttt{RNA} \}, \ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \ \{ \texttt{GUCY1A3}, \ \texttt{RNA} \}, \\ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \\ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \\ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \\ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \\ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \\ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \ \{ \texttt{SEC31A}, \ \texttt{RNA} \}, \\ \{ \texttt{SEC31A}, \ \texttt{RN
```

{ADAM9, RNA}, {KAT6A, RNA}, {PTENP1, RNA}, {CDK20, RNA}, {RPS6KA3, RNA}, {CASK, RNA}}

We may also want to know what these frequencies correspond to. The "LombScargle" method uses a LombScargle transformation.

{FNIP2, RNA}, {KIAA1430, RNA}, {ZFR, RNA}, {JMY, RNA}, {SEC24A, RNA}, {PTP4A1, RNA}, {HACE1, RNA}, {ZBTB24, RNA}, {HECA, RNA}, {RP9, RNA}, {BBS9, RNA}, {ATXN7L1, RNA}, {C7orf60, RNA}, {MFHAS1, RNA},

LombScargle[data, setTimes]	calculates the Lomb–Scargle power spectrum for time series <i>data</i> that runs over specified <i>setTimes</i> . It takes as input:	
	data	Time series (data as a list; list may be the value of a single key in an association). The series may include Missing data points. Data may be entered as list of N signal intensities corresponding one–to–one to the N setTimes with Missing inserted appropriately if the data is absent, $ \{X_1 = X \ (t_1) \ , X_2 = X \ (t_2) \ , \dots \ , X_N = X \ (t_N) \ \}. $ Alternatively, the data may be a list of pairs of values $ \{\{t_1, X_1\}, \{t_2, X_2\}, \dots, \{t_N, X_N\}\} $ for only existing measurements.
	setTimes	A complete set of all possible N times during which data could have been collected in the window of the experiment, including times for which no data was collected, { t ₁ , t ₂ ,, t _N }.

Calculating the power spectrum of a (possibly unevenly sampled) time series.

option name	default value	
FrequenciesOnly	False	Whether to return only the computation frequencies. An association of frequencies "f" ordered from low to high by index i is returned in the form: $< \text{"f1"} \rightarrow \text{frequency}_1,\\ \text{"f2"} \rightarrow \text{frequency}_2, \ldots,\\ \text{"fi"} \rightarrow \text{frequency}_{i,\ldots,}\text{"fn"} \rightarrow \text{frequency}_n >$
NormalizeIntensities	False	Whether the intensities list should be normalized or not.
OversamplingRate	1	Rate at which to oversample the time series using zero-padding.
PairReturn	False	Whether data should be returned as {frequency list,intensity list} or as pairs: {{frequency1,intensity1}, {frequency2, intensity2},,{frequencyN,intensityN}.
UpperFrequencyFactor	1	Value ≥ 1 , by which to scale the upper Nyquist cutoff frequency and increase spectral resolution.

Options for LombScargle

To obtain the possible frequencies we simply run LombScargle over the desired times for one of the time series and set the FrequenciesOnly option to True:

```
In[40]:= LombScargle[rnaFinalTimeSeries[[1]], timesRNA, FrequenciesOnly \rightarrow True]
Out[40] = \langle | f1 \rightarrow 0.00500668, f2 \rightarrow 0.0104306, f3 \rightarrow 0.0158545,
             f4 \rightarrow 0.0212784, f5 \rightarrow 0.0267023, f6 \rightarrow 0.0321262, f7 \rightarrow 0.0375501 | \rangle
```

Proteomic Data

Importing OmicsObject Proteome Data

We now import the proteomics data example (for details on how to import such data please refer to DataImporter, DataImporterDirect, DataImporterDirectLabeled and OmicsObjectCreator documentation).

We import the proteomics OmicsObject MathIOmica example:

```
In[41]:= proteinExample = Get[FileNameJoin[{ConstantMathIOmicaExamplesDirectory, "proteinExample"}]]
                                                                                           \label{eq:continuous} <\mid 7 \rightarrow <\mid \{ \text{A0AVT1, Protein} \} \rightarrow \{ \{ \text{0.937} \} \text{, } \{ \text{17} \} \} \text{, } \{ \text{A0FGR8, Protein} \} \rightarrow \{ \{ \text{1.073} \} \text{, } \{ \text{24} \} \} \text{, } \{ \text{A0FGR8, Protein} \} \rightarrow \{ \{ \text{1.073} \} \text{, } \{ \text{24} \} \} \text{, } \{ \text{A0FGR8, Protein} \} \rightarrow \{ \{ \text{1.073} \} \text{, } \{ \text{24} \} \} \text{, } \{ \text{A0FGR8, Protein} \} \rightarrow \{ \{ \text{1.073} \} \text{, } \{ \text{24} \} \} 
                                                                                                                        \{AOMZ66, Protein\} \rightarrow \{\{1.059\}, \{9\}\}, \dots 5219 \dots, \{Q9Y6I4, Protein\} \rightarrow Missing[], \{AOMZ66, Protein\} \rightarrow \{\{1.059\}, \{9\}\}, \dots 5219 \dots \}
                                                                                                                            \{ \texttt{Q9Y6I9, Protein} \} \rightarrow \texttt{Missing[], } \{ \texttt{Q9Y6X3, Protein} \} \rightarrow \texttt{Missing[]} \mid \rangle \text{,}
                                                                                                  9 \rightarrow \langle | \cdots 1 \cdots | \rangle \text{, } \cdots 9 \cdots \text{, } 20 \rightarrow | \cdots 1 \cdots \text{, } 21 \rightarrow \langle | \cdots 1 \cdots | \rangle \text{ } | \rangle
                                                                                                                                                                                                          show less
                                                                                                                                                                                                                                                                                                                                                                                                                                show all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          set size limit...
                                                                                         large output
                                                                                                                                                                                                                                                                                                                show more
```

There are multiple samples given by the outer associations. We can use Query to get any data. For example we can get the outer keys:

```
In[42]:= Query[Keys]@proteinExample
Out[42]= {7, 9, 10, 11, 14, 12, 13, 15, 16, 17, 19, 20, 21}
```

We notice that sample 8 is missing - this is because it was used as a reference in the proteomics experiment. Point 18 is missing as there was no sample for that time point. We will address this in the next section.

We can get the expression raw data from any sample and entry. For example, the 14th and 214th entries in sample 12:

```
In[43]:= Query["12", {14, 22}]@proteinExample
Out[43] = \langle | \{A5PLN9, Protein\} \rightarrow \{\{1.057\}, \{3\}\}, \{A6NGU5, Protein\} \rightarrow Missing[] | \rangle
```

The keys correspond to UniProt accessions, and have been tagged with a "Protein" label as well. The values of all the keys/IDs correspond {{measurements}, {metadata}}, and in this particular {{relative intensity compared to reference}, {number of unique peptides identified for the given protein}}.

The measurement for each protein is a relative intensity, i.e. the ratio of the value for the protein compared to the reference timepoint that has been chosen as the healthy sample "8", day "255" (in the experiment this was TMT reporter with 126 amu). The last list, the "metadata", in the proteomics OmicsObject was chosen to be the number of unique peptides identified for the given protein.

Additional Information: Gene Translation

As an aside, let us consider the form of the protein identifiers. MathIOmica can perform basic GeneTranslation going from one kind of identifier to another, using GetGeneDictionary:

GeneTranslation [inputIDList, targetIDList, geneDictionary]	uses <i>geneDictionary</i> to convert <i>inputIDList</i> IDs to different annotations as indicated by <i>targetIDList</i> . It takes for inputs:	
	inputIDList	List of n IDs (strings) to be converted in the form $\{ \text{inputID}_{1,} \text{ inputID}_{2}, \ldots, \\ \text{inputID}_{n} \}$
	targetIDList	List of target identifier strings, as used in the gene geneDictio- nary, { target ID_1 , , target ID_2 , target ID_k } e.g. {"UniProt ID","Gene Symbol"}. Can also be provided as a single string for only one kind of IDs.
	geneDictionary	Gene dictionary to base translation on in the form generated by GetGeneDictionary .
GetGeneDictionary[]		n dictionary from a UCSC table search – typically etGeneDictionary uses MathIOmica data for the

Translating gene identifiers using a gene dictionary.

We use GetGeneDictionary to define a gene dictionary:

```
In[44]:= geneDictionary = GetGeneDictionary[]
                                                               \langle | \text{human} \rightarrow \langle | \text{UCSC ID} \rightarrow \{ \text{uc001aaa.3, uc010nxr.1, uc010nxq.1, uc001aal.1, uc001aaq.2, uc001aar.2, uc00
                                                                                                uc001aau.3, uc021oeh.1, ...121567..., uc022cfk.1, uc031tkn.1, uc022cgh.1, uc022cha.1,
                                                                                                show all
                                                                                                                                                                                                                                                                                                                                                          set size limit...
                                                            large output
                                                                                                                                          show less
                                                                                                                                                                                                               show more
```

The current version of the gene dictionary has accessions for the following identifiers:

```
In[45]:= Query[All, Keys]@geneDictionary
Out[45]= ⟨|human → {UCSC ID, UniProt ID, Gene Symbol, RefSeq ID,
         NCBI Protein Accession, Ensembl ID, KEGG Gene ID, HGU133Plus2 Affymetrix ID}|>
      We can now use GeneTranslation (setting the optional InputID to "UniProt ID") to convert our example "UniProt ID" acces-
      sions to "Gene Symbol":
In[46]:= GeneTranslation[{"A5PLN9", "A6NGU5"}, {"Gene Symbol"}, geneDictionary, InputID→ {"UniProt ID"}]
```

We note that an ID might not necessarily be annotated across all databases, as in the above example.

Processing of Proteome Data

We will next preprocess the imported proteome data. We will first perform a transformation on the data towards a normal distribution, then we will re-label the samples with real time and carry out filtering for unique peptides present in each protein identification, as well as for missing data. Finally, we will create the proteomics time series or relative intensities compared to the healthy reference point for each protein.

Power Transformation, Labeling and Filtering

Data Power Transformation

To make the data comparable across time points, and as close to a normal distribution as possible for each sample, we normalize each time point /sample by using ApplyBoxCoxTransform.

ApplyBoxCoxTransform [data]	for a given ${\it data}$ set, computes the Box–Cox transformation at the maximum likelihood λ parameter.

Applying a power transformation (Box-Cox) for an optimized parameter for each dataset.

option name	default value	
ListIndex	Missing[]	Selection of which list to use in the OmicsObject input.
ComponentIndex	Missing[]	Selection of which component of a list to use in the OmicsObject input.
HorizontalSelection	False	Horizontal selection across components for a single level association with multi-list values.

 ${\color{red} \textbf{Options for ApplyBoxCoxTransform}}\;.$

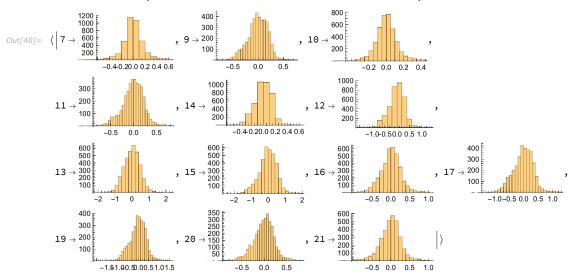

We apply a Box-Cox transformation to the proteomics data measurement in the OmicsObject, which is in the first list first component for each identifier. The optimized $\hat{\lambda}$ parameter for each sample is printed out for reference:

```
In[47]:= transformedProteinData = ApplyBoxCoxTransform[proteinExample, ListIndex \rightarrow 1, ComponentIndex \rightarrow 1]
```

```
Calculated Box-Cox parameter \hat{\lambda} = -0.152638
       Calculated Box-Cox parameter \hat{\lambda} = -0.177086
       Calculated Box-Cox parameter \hat{\lambda} = -0.421581
       Calculated Box-Cox parameter \hat{\lambda} = -0.292287
       Calculated Box-Cox parameter \hat{\lambda} = -0.432042
       Calculated Box-Cox parameter \hat{\lambda} = 0.346673
       Calculated Box-Cox parameter \hat{\lambda} = 0.368061
       Calculated Box-Cox parameter \hat{\lambda} = 0.0834073
       Calculated Box-Cox parameter \hat{\lambda} = 0.13413
       Calculated Box-Cox parameter \hat{\lambda} = 0.166336
       Calculated Box-Cox parameter \hat{\lambda} = 0.0866284
       Calculated Box-Cox parameter \hat{\lambda} = -0.199247
       Calculated Box-Cox parameter \hat{\lambda} = -0.221778
   < \mid 7 \rightarrow < \mid \{ \text{A0AVT1, Protein} \} \rightarrow \{ \{ -0.0653962 \}, \{ 17. \} \}, \{ \text{A0FGR8, Protein} \} \rightarrow \{ \{ 0.0700809 \}, \{ 24. \} \}, \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17. \} \}, \{ 17. \} \rightarrow < \mid \{ 17
                 0.05221..., {Q9Y6I9, Protein} \rightarrow Missing[], {Q9Y6X3, Protein} \rightarrow Missing[] \rightarrow,
       (\cdots 11 \cdots), (21 \rightarrow \langle A0AVT1, Protein) \rightarrow \{\{-(\cdots 21 \cdots)\}, (\cdots 1 \cdots)\}, (\cdots 5223 \cdots), (\cdots 1 \cdots) \rangle \rangle
large output
                                                         show less
                                                                                                              show more
```

We can plot the data to see what the resulting distributions look like:

In[48]:= Histogram[#] & /@ (Query[All, Values, 1, 1]@transformedProteinData)

Re-labeling Samples with Times

As with the transcriptome, we notice that the sample numberings do not correspond to actual days, so we may adjust using the sampleToDays association created before and reproduced here for reference:

```
In[49]:= sampleToDays =
          <!"7" → "186", "8" → "255", "9" → "289", "10" → "290", "11" → "292", "12" → "294", "13" → "297", "14" → "301",
           "15" → "307", "16" → "311", "17" → "322", "18" → "329", "19" → "369", "20" → "380", "21" → "400"|>;
```

We can now do a KeyMap to rename the outer keys:

```
Inf50]:= proteinLongitudinal = KeyMap[sampleToDays, transformedProteinData]
```

```
\langle | 186 \rightarrow \langle | \{ A0AVT1, Protein \} \rightarrow \{ \{ -0.0653962 \}, \{ 17. \} \}, 
   \{AOFGR8, Protein\} \rightarrow \{\{0.0700809\}, \{24.\}\}, \{AOMZ66, Protein\} \rightarrow \{\{0.057075\}, \{9.\}\}, \dots, \{24.\}\}
   large output
             show less
                        show more
                                     show all
                                               set size limit..
```

Now let's check the timepoints in this dataset:

```
In[51]:= timesProteinRawData = TimeExtractor[proteinLongitudinal]
Out[51]= {186, 289, 290, 292, 294, 297, 301, 307, 311, 322, 369, 380, 400}
```

We notice a small complication: there are two timepoints missing, compared to the transcriptome: (i) the reference time point "255" does not appear explicitely in our computation (corresponding to a zero value about which other timepoints are computed for proteins with at least 2 unique peptides). (ii) there is no sample for day "329".

We can use the ConstantAssociator function to append these to the transformed data. timepoints "255" (zero measurement assumed to have at least 2 unique peptides available per protein) and "329", assumed to be Missing data:

```
In[52]:= proteinLongitudinalEnlarged =
        ConstantAssociator[proteinLongitudinal, <|"255" → {{0}, {2}}, "329" → Missing[]|>]
```

```
<\mid 186 \rightarrow <\mid \{ \texttt{A0AVT1, Protein} \} \rightarrow \{ \, \{ \texttt{-0.0653962} \, \} \,, \, \, \{ \, 17. \, \} \, \} \,,
    \{AOFGR8, Protein\} \rightarrow \{\{0.0700809\}, \{24.\}\}, \{AOMZ66, Protein\} \rightarrow \{\{0.057075\}, \{9.\}\}, \dots, \{24.\}\}
    large output
              show less
                           show more
                                         show all
                                                     set size limit...
```

We can now check the timepoints again:

```
In[53]:= timesProtein = TimeExtractor[proteinLongitudinalEnlarged]
Out[53] = \{186, 255, 289, 290, 292, 294, 297, 301, 307, 311, 322, 329, 369, 380, 400\}
```

Filter Unique Peptides

Typically, proteomics data from mass spectrometry is filtered to retain only identifications of proteins that are supported by at least 2 unique peptides having been identified per protein. We can use FilteringFunction to implement the filtering:

```
FilteringFunction[omicsObject, cutoff]
```

filters OmicsObject data by a chosen comparison (by default greatr or equal) to a cutoff.

FilteringFunction can be used to filter data in an OmicsObject.

option name	default value	
ListIndex	Missing[]	Selection of which list to use in the OmicsObject input.
ComponentIndex	Missing[]	Selection of which component of a list to use in the OmicsObject input.
SelectionFunction	GreaterEqual	Selection of comparison to use for filtering.

Options for FilteringFunction.

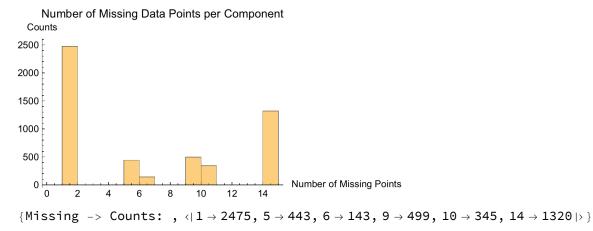

We filter out proteomics data with less than 2 unique peptides per protein. The unique peptides is reported as the second list, first component in the OmicsObject values in this case:

```
In[54]:= proteinUnique = FilteringFunction[proteinLongitudinalEnlarged, 2, ListIndex → 2, ComponentIndex → 1]
                                                                                                           < \mid 186 \rightarrow < \mid \{ \texttt{A0AVT1, Protein} \} \rightarrow \{ \{ \texttt{-0.0653962} \} \text{, } \{ \texttt{17.} \} \} \text{,}
                                                                                                                                               \{AOFGR8, Protein\} \rightarrow \{\{0.0700809\}, \{24.\}\}, \{AOMZ66, Protein\} \rightarrow \{\{0.057075\}, \{9.\}\}, \dots 5220 \dots, \{4.\}\}
Out[54]=
                                                                                                                                                  \{ \texttt{Q9Y616}, \, \texttt{Protein} \} \rightarrow \texttt{Missing[]}, \, \{ \texttt{Q9Y6X3}, \, \texttt{Protein} \} \rightarrow \texttt{Missing[]} \mid \rangle, \, \underbrace{\texttt{missing[]}}, \, \texttt{329} \rightarrow \langle | \texttt{missing[]}, \\ | \texttt{Missing[]} \mid \rangle, \, \underbrace{\texttt{Missing[]}}, \, \underbrace{\texttt{Q9Y6X3}}, \, \underbrace{\texttt{Protein}}, \, \underbrace{\texttt{Missing[]}}, \, \underbrace
                                                                                                         large output
                                                                                                                                                                                                                                          show less
                                                                                                                                                                                                                                                                                                                                                                show more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   show all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        set size limit...
```

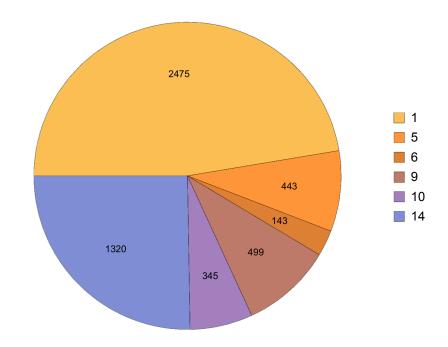

Filter Data

We will next remove values that have been tagged as Missing[], retaining data that have at least 3/4 data points available across all samples. Here we use the function FilterMissing:

```
In[55]:= filteredProteinData = FilterMissing[proteinUnique, 3/4]
```

Pie Chart of number of missing components

                                                                                                                                                                                                                                                                                                                  show less
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     show more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   show all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     set size limit...
```

Create Proteome Time Series

We can now create time series for each of the proteins.

For each protein we now extract a time series (list of values) corresponding to these times:

```
In[56]:= timeSeriesProtein = CreateTimeSeries[filteredProteinData]
```

```
\langle | \{ \text{AOAVT1, Protein} \} \rightarrow \{ -0.0653962, 0, 0.00299471, -0.0348449, -0.0182123, 0.0627073, \dots \} 
    0.0829594, 0.0689856, Missing[], -0.050132, -0.137674, -0.0120888}, ....2473..., ....1...
large output
              show less
                           show more
                                         show all
                                                     set size limit...
```

Take the Norm and Remove Constant Proteome Time Series

Next, we normalize each protein series, using SeriesApplier:

```
In[57]:= normedProteinAll = SeriesApplier[Normalize, timeSeriesProtein]
```

```
 < | ~ \{ A0AVT1, ~ Protein \} \rightarrow \{ -0.205122, ~ 0., ~ 0.00939321, ~ -0.109294, ~ -0.0571245, ~ 0.196687, ~ 0.529638, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.109687, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.10968, ~ 0.

```

Resampling Proteome Data

In addition to the above, we want to create a resampled distribution for the proteome dataset prior to classification and clustering. In this subsection we first resample the imported and labeled proteome dataset, Then, we carry out the full analysis in this "bootstrap" dataset, to create a set of random proteome time series. This bootstrap distribution of time series will be used to provide the cutoffs used in the time series classification in the following subsection.

Resampling the Proteome Data

We create a resampling of 100000 sets:

```
In[59]:= proteinBootstrap = BootstrapGeneral[proteinExample, 100 000]
```

```
<|7 \rightarrow <|1 \rightarrow \{\{0.943\}, \{13\}\}, 2 \rightarrow \{\{1.033\}, \{4\}\}, 3 \rightarrow \{\{1.048\}, \{3\}\}, 4 \rightarrow \texttt{Missing[]}, 5 \rightarrow \texttt{Missing
                                             6 \rightarrow \{\{0.946\}, \{31\}\}, \dots 99988 \dots, 99995 \rightarrow Missing[], 99996 \rightarrow \{\{0.948\}, \{19\}\}, 99997 \rightarrow \{\{0.993\}, \{6\}\}, \{19\}\}
                                           99\,998 \to \{\{0.876\}, \{2\}\}, 99\,999 \to \{\{1.102\}, \{39\}\}, 100\,000 \to \{\{0.906\}, \{14\}\} \mid \rangle, \dots \mid 1 \mid \dots \mid \rangle, \mid 21 \to \langle \mid \dots \mid 1 \mid \dots \mid \rangle \mid \rangle
large output
                                                                                                                                                    show less
                                                                                                                                                                                                                                                                                           show more
                                                                                                                                                                                                                                                                                                                                                                                                                                               show all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        set size limit...
```

Processing the Bootstrap Proteome and Creating Bootstrap Time Series

We apply a Box-Cox transformation to the bootstrap set proteomics data measurement in the OmicsObject, which is in the first list first component for each identifier. The optimized $\hat{\lambda}$ parameter for each sample is printed out for reference:

In[60]:= transformedProteinBootstrapData = ApplyBoxCoxTransform[proteinBootstrap, ListIndex → 1, ComponentIndex → 1]

```
Calculated Box-Cox parameter \hat{\lambda} = -0.210137
            Calculated Box-Cox parameter \hat{\lambda} = -0.209165
            Calculated Box-Cox parameter \hat{\lambda} = -0.412662
            Calculated Box-Cox parameter \hat{\lambda} = -0.28829
            Calculated Box-Cox parameter \hat{\lambda} = -0.454618
            Calculated Box-Cox parameter \hat{\lambda} = 0.346507
            Calculated Box-Cox parameter \hat{\lambda} = 0.385014
            Calculated Box-Cox parameter \hat{\lambda} = 0.0797884
            Calculated Box-Cox parameter \hat{\lambda} = 0.165965
            Calculated Box-Cox parameter \hat{\lambda} = 0.143803
            Calculated Box-Cox parameter \hat{\lambda} = 0.0989413
            Calculated Box-Cox parameter \hat{\lambda} = -0.184469
            Calculated Box-Cox parameter \hat{\lambda} = -0.234572
           \langle |7 \rightarrow \langle |1 \rightarrow \{\{-0.0590524\}, \{13.\}\}\}, 2 \rightarrow \{\{0.0323567\}, \{4.\}\}\},
              3 \rightarrow \{\{0.0466534\}, \{3.\}\}, 4 \rightarrow Missing[], \dots 99993\dots, 99998 \rightarrow \{\{-0.134248\}, \{2.\}\}, \{3.\}\}
              99999 \rightarrow \{\{0.0961422\}, \{39.\}\}, 100000 \rightarrow \{\{-0.099747\}, \{14.\}\} \mid >, \dots \downarrow 11 \dots, 21 \rightarrow \langle \mid \dots \downarrow 1 \mid \dots \mid > \mid > \mid > \}
          large output
                        show less
                                    show more
                                                 show all
                                                            set size limit...
        We can now do a KeyMap to rename the outer keys to actual days:
In[61]:= proteinBootstrapLongitudinal = KeyMap[sampleToDays, transformedProteinBootstrapData];
        Now let's check the timepoints in this dataset:
In[62]:= timesProteinBootstrapData = TimeExtractor[proteinBootstrapLongitudinal]
Out[62] = \{186, 289, 290, 292, 294, 297, 301, 307, 311, 322, 369, 380, 400\}
        As with the regular protein data above use the ConstantAssociator function to append these to the transformed bootstrap
        data. Timepoints "255" (zero measurement assumed to have at least 2 unique peptides available per protein) and "329",
        assumed to be Missing data:
In[63]:= proteinBootstrapLongitudinalEnlarged =
           ConstantAssociator[proteinBootstrapLongitudinal, <|"255" → {{0}, {2}}, "329" → Missing[]|>];
        We can now check the timepoints again:
```

In/641:= timesProteinBootstrap = TimeExtractor[proteinBootstrapLongitudinalEnlarged] $Out[64] = \{186, 255, 289, 290, 292, 294, 297, 301, 307, 311, 322, 329, 369, 380, 400\}$

We filter out proteomics bootstrap data with less than 2 unique peptides per protein. The unique peptides is reported as the second list, first component in the OmicsObject values in this case:

In[65]:= proteinBootstrapUnique =

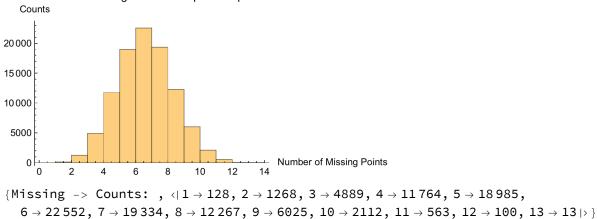

FilteringFunction [proteinBootstrapLongitudinalEnlarged, 2, ListIndex → 2, ComponentIndex → 1]

```
 <\!\!\! \{1 \rightarrow \{\{-0.0590524\}, \{13.\}\}, 2 \rightarrow \{\{0.0323567\}, \{4.\}\}, 3 \rightarrow \{\{0.0466534\}, \{3.\}\}, 6 \rightarrow \{\{-0.0558378\}, \{31.\}\}, 6 \rightarrow \{\{-0.0558378\}, (31.)\}, 6 \rightarrow \{\{-0.0588378\}, (31.)\}, (31.)\}, (31.)
                                \underbrace{\text{... 99 992 ...}}, \ 3321 \rightarrow \texttt{Missing[], 28 249} \rightarrow \texttt{Missing[], 85 458} \rightarrow \texttt{Missing[], 99 991} \rightarrow \texttt{Missing[]} ),

                                                                                                           large output
                                                                                                                                                                                                                                                show less
                                                                                                                                                                                                                                                                                                                                                                            show more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  show all
```

For each bootstrap protein we now extract a time series (list of values):

In[67]:= timeSeriesProteinBootstrap = CreateTimeSeries[filteredProteinBootstrapData]

```
\langle | 2 \rightarrow \{0.0323567, 0, 0.0178067, 0.0177744, 0.140317, -0.129398, Missing[], \}
    0.203463, Missing[], 0.288878, -0.169866, Missing[], -0.386924, 0.103362, 0.0735377},
 \cdots 6283 \cdots , 98 744 \rightarrow {Missing[], 0, Missing[], 0.0187488, 0.256245, 0.236313, 0.169999,
     0.0284025, \, 0.114743, \, 0.393487, \, -0.503409, \, \texttt{Missing[]}, \, 0.272097, \, 0.0390792, \, -0.22122\} \, | > 1 \} 
              show less
                                           show all
                                                       set size limit...
large output
                            show more
```

Next, we normalize each protein series, using SeriesApplier:

In[68]:= normedProteinBootstrapAll = SeriesApplier[Normalize, timeSeriesProteinBootstrap]

```
\langle | 2 \rightarrow \{0.0541072, 0., 0.0297765, 0.0297225, 0.23464, -0.216381, Missing[], \}
           0.340234, Missing[], 0.483065, -0.284052, Missing[], -0.647019, 0.172843, 0.122971},
          \cdots 6283 \cdots , 98 744 \rightarrow {Missing[], 0., Missing[], 0.0224495, 0.306823, 0.282957, 0.203553,
Out[68]=
           large output
                   show less
                             show more
                                        show all
                                                 set size limit...
```

Finally, we use ConstantSeriesClean to remove constant series, as we are interested in changing time patterns:

In/69:= proteinBootstrapFinalTimeSeries = ConstantSeriesClean[normedProteinBootstrapAll]

```
large output
             show less
                          show more
                                       show all
                                                  set size limit...
```

Classification of Proteome Time Series

In this subsection we will classify the proteome time series based on patterns in the series. For the classification we will use TimeSeriesClassification. We will use QuantileEstimator for the "LombScargle" method to provide a cutoff for the TimeSeriesClassification inputs.

First, we estimate for the "LombScargle" Method, 0.95 quantile cutoff from the bootstrap proteome data:

```
In[70]:= q95Protein = QuantileEstimator[proteinBootstrapFinalTimeSeries, timesProteinBootstrap]
Out[70]= 0.836405
```

Next, we estimate the "Spikes" 0.95 quantile cutoff from the bootstrap proteome data:

```
In[71]:= q95ProteinSpikes =
                                                                                                                            QuantileEstimator[proteinBootstrapFinalTimeSeries, timesProteinBootstrap, Method → "Spikes"]
\textit{Out}[71] = \langle | 12 \rightarrow \{0.819506, -0.832884\}, 13 \rightarrow \{0.791436, -0.820784\}, 14 \rightarrow \{0.796826, -0.787358\} | \rangle \rangle \rangle \rangle \rangle \langle | 12 \rightarrow \{0.819506, -0.832884\}, 13 \rightarrow \{0.819506, -0.832884\}, 14 \rightarrow \{0.819506, -0.83288
```

Now we can classify the proteome time series data based on these cutoffs:

```
In[72]:= proteinClassification = TimeSeriesClassification[proteinFinalTimeSeries,
         timesProtein, LombScargleCutoff → q95Protein, SpikeCutoffs → q95ProteinSpikes]
```

Method → "LombScargle"

```
\langle | SpikeMax \rightarrow \langle | \cdots 1 \cdots | \rangle, \cdots 4 \cdots \rangle
  f7 \rightarrow \langle | \{014579, Protein\} \rightarrow \{ \{0.129387, 0.0330284, 0.0764435, 0.001172, 0.187055, 0.279572, 0.929071 \}, \}
         \{\cdots 1\cdots\}\}, \cdots 16\cdots, \{Q9HC38, Protein\} \rightarrow \{\cdots 1\cdots\}|\rangle|\rangle
large output
                   show less
                                      show more
                                                           show all
                                                                           set size limit...
```

As discussed above, the default output for TimeSeriesClassification is an Association with outer keys being the classificainner keys being the class members, and each class member value being a list of {{computed classification vector}, {input data list}}.

If we want the classes produced, we can query the keys:

```
In[73]:= Keys[proteinClassification]
Out[73]= {SpikeMax, SpikeMin, f1, f5, f6, f7}
```

For the number of members in each class we have:

```
In[74]:= Query[All, Length]@proteinClassification
Out 747 = \langle | SpikeMax \rightarrow 108, SpikeMin \rightarrow 75, f1 \rightarrow 76, f5 \rightarrow 6, f6 \rightarrow 36, f7 \rightarrow 18 | \rangle
```

We can obtain the membership list in any class of interest:

```
In[75]:= Query["f1", Keys]@proteinClassification
```

```
Out[75]= {{000160, Protein}, {000267, Protein}, {000273, Protein}, {000571, Protein},
        \{015031,\, Protein\}\,,\,\, \{043143,\, Protein\}\,,\,\, \{043175,\, Protein\}\,,\,\, \{043312,\, Protein\}\,,
         {043516, Protein}, {060271, Protein}, {060879, Protein}, {075643, Protein},
         {075792, Protein}, {095498, Protein}, {P00488, Protein}, {P00915, Protein},
        {P02042, Protein}, {P02671, Protein}, {P04844, Protein}, {P08174, Protein}, {P09326, Protein},
        {P09496, Protein}, {P11021, Protein}, {P12956, Protein}, {P13501, Protein}, {P13611, Protein},
        {P13667, Protein}, {P19387, Protein}, {P23141, Protein}, {P23368, Protein}, {P32119, Protein},
         {P32189, Protein}, {P33176, Protein}, {P40306, Protein}, {P42892, Protein}, {P50225, Protein},
         {P51531, Protein}, {P52888, Protein}, {P54920, Protein}, {P55036, Protein}, {P60660, Protein},
         {P84095, Protein}, {Q01518, Protein}, {Q07021, Protein}, {Q08722, Protein}, {Q09666, Protein},
         {Q13151, Protein}, {Q13217, Protein}, {Q13488, Protein}, {Q14165, Protein}, {Q14653, Protein},
         {Q15084, Protein}, {Q5H9R7, Protein}, {Q6NYC8, Protein}, {Q709C8, Protein}, {Q86YP4, Protein},
        {Q92499, Protein}, {Q96AT9, Protein}, {Q96L92, Protein}, {Q96RT1, Protein}, {Q99439, Protein},
         {Q9BTE3, Protein}, {Q9BTV4, Protein}, {Q9BWS9, Protein}, {Q9C0I1, Protein}, {Q9H0D6, Protein},
         {Q9H2U2, Protein}, {Q9H444, Protein}, {Q9H4Z3, Protein}, {Q9NS69, Protein}, {Q9NUP9, Protein},
         {Q9NVJ2, Protein}, {Q9NYB0, Protein}, {Q9UQ35, Protein}, {Q9Y277, Protein}, {Q9Y2Q0, Protein}}
```

To obtain the possible frequencies we simply run LombScargle over the desired times for one of the time series and set the FrequenciesOnly option to True:

```
In/76?:= LombScargle[proteinFinalTimeSeries[[1]], timesRNA, FrequenciesOnly → True]
Out[76]= \langle | f1 \rightarrow 0.00500668, f2 \rightarrow 0.0104306, f3 \rightarrow 0.0158545, | f3 \rightarrow 0.0158545, | f4 \rightarrow 0.00500668, f4 \rightarrow 0.0158545, | f4 \rightarrow 0.00500668, f5 \rightarrow 0.0158545, | f4 \rightarrow 0.00500668, | f5 \rightarrow 0.0104306, | f5 \rightarrow 0.0158545, | f
                                                                                                                                                f4 \rightarrow 0.0212784, f5 \rightarrow 0.0267023, f6 \rightarrow 0.0321262, f7 \rightarrow 0.0375501 | \rangle
```

Metabolomic Data

Importing OmicsObject Metabolome Data

We now import the metabolomics data example (for details on how to import such data please refer to DataImporter, DataImporterDirect, DataImporterDirectLabeled and OmicsObjectCreator documentation).

We import the metabolomics OmicsObject MathIOmica examples for each of positive and negative mass spectrometry aligned mass features:

In[77]:= metabolitesNegativeModeExample = Get[FileNameJoin[{ConstantMathIOmicaExamplesDirectory, "metabolomicsNegativeModeExample"}]]

```
\langle | 8 \rightarrow \langle | \{457.002, 0.34764, Meta\} \rightarrow \langle | 8 \rightarrow \langle | \{457.002, 0.34764, Meta\} \rangle \rangle
       {{23444, 16317, 1}, { [ C16 H11 N9 S4, db=0.00, overall=47.55, mfg=95.11 ], }},
      2289 \cdots, {421.948, 0.392875, Meta} \rightarrow {{1, 115528, 130042},
         \{ \text{ [ C11 H12 Cl2 011 S, db=0.00, overall=48.58, mfg=97.17 ], }} | \rangle, \dots 10 \dots, 20 \rightarrow \langle | \dots 1 \dots | \rangle | \rangle \}
large output
                   show less
                                     show more
                                                         show all
                                                                        set size limit...
```

In[78]:= metabolitesPositiveModeExample = ${\tt Get[FileNameJoin[\{ConstantMathIOmicaExamplesDirectory, "metabolomicsPositiveModeExample"\}]]} \\$

```
< \mid 8 \rightarrow < \mid \{202.033, \ 0.332607, \ \text{Meta}\} \rightarrow \{\{263.741, \ 276.622, \ 337.241\}, \ \{\ ,\ \}\},
                       \{174.038, 0.334514, Meta\} \rightarrow \{\{78435, 88529, 121073\}, \{, \}\},
                        \cdots 3670 \cdots , {422.34, 14.7601, Meta} \rightarrow {{1, 36919, 102737}, {, }} \mid>,
Out[78]=
                   9 \rightarrow \langle | \cdots 1 \cdots | \rangle, \cdots 8 \cdots, 19 \rightarrow \langle | \cdots 1 \cdots | \rangle, 20 \rightarrow \langle | \cdots 1 \cdots | \rangle | \rangle
                 large output
                                       show less
                                                          show more
                                                                                show all
                                                                                                 set size limit...
```

There are multiple samples given by the outer associations. We can use Query to get any data. For example we can get the outer keys:

```
In[79]:= Query[Keys]@metabolitesNegativeModeExample
Out[79]= {8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 19, 20}
In[80]:= Query[Keys]@metabolitesPositiveModeExample
Out[80]= {8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 19, 20}
```

We notice that sample 7, 18 and 21 are missing as there was no sample for these time points. This will be addressed further below.

We can get the intensity data from any sample and entry. For example, the 77th and 155th entries in sample 14:

```
In[81]:= Query["14", {77, 155}]@metabolitesNegativeModeExample
Out[81]= \langle | \{322.089, 0.440241, Meta\} \rangle
                                                                                                                                    {31950, 29801, 27440}, {Isosorbide-2-glucuronide [ C12 H18 O10, db=60.03, overall=60.67, mfg=61.31, db=60.03, db=60.03, overall=60.67, mfg=61.31, db=60.03, db=60.03, overall=60.67, mfg=61.31, db=60.03, 
                                                                                                                                                                                            KEGG ID=, CAS ID=29542-01-6], 29542-01-6}, \{146.059, 0.742692, Meta\} \rightarrow \{\{62667, 1, 60382\}, 146.059, 1742692, Meta\} \rightarrow \{\{62667, 1, 60382\}, Meta\} \rightarrow \{\{6667, 1, 60382\}, Meta\} \rightarrow \{\{
                                                                                                                                                  Adipic acid [ C6 H10 O4, db=45.74, overall=46.59, mfg=47.44, KEGG ID=, CAS ID=124-04-9 ], 124-04-9}}
```

The outer keys correspond to the identified features in the form {mass to charge ratio (m/z), retention time, "Meta"}, i.e. each m/z and retention time has been tagged with a "Meta" label as well to indicate these are metabolomics data. The values of all the keys/IDs correspond to {{measurements}, {metadata}}, and in this particular example:

```
{{intensity technical replicate 1, intensity technical replicate 2, intensity technical replicate 3},.
{Annotations, CAS Number}}
```

We would like to combine the positive and negative mode metabolomics data. We will use EnlargeInnerAssociation:

```
In[82]:= metabolitesExample =
```

 $EnlargeInnerAssociation [\{metabolitesNegativeModeExample, metabolitesPositiveModeExample \}] \\$

```
\langle | 8 \rightarrow \langle | \{457.002, 0.34764, Meta\} \rightarrow \langle | 8 \rightarrow \langle | \{457.002, 0.34764, Meta\} \rangle
       {{23444, 16317, 1}, { [ C16 H11 N9 S4, db=0.00, overall=47.55, mfg=95.11 ], }},
      5962, {422.34, 14.7601, Meta} → {{1, 36919, 102737}, {, }} |>, 10
 20 \rightarrow \langle \{457.002, 0.34764, Meta\} \rightarrow \{\{\cdots 1\cdots\}, \cdots 1\cdots\}, \cdots 5962\cdots, \cdots 1\cdots | \rangle | \rangle
large output
                   show less
                                    show more
                                                       show all
                                                                      set size limit...
```

Processing of Metabolome Data

We will next preprocess the imported metabolome data. We will first perform calculate the median of the technical replicates, transform the data towards a normal distribution, then we will re-label the samples with real time and carry out filtering for missing data. Finally, we will create the metabolomics time series or relative intensities compared to the healthy reference point for each mass feature identified.

Medians of Technical Triplicates, Data Transformation, Labeling, Filtering, Matching Mass

Median of Technical Triplicates

The metabolomics intensities have three measurements, corresponding to technical triplicates. Typically we would like to use the median of these values. An additional complication is that some of the triplicates have intensity values of 1, which should be taken as a Missing value. We can use MeasurementApplier to perform the calculation:

MeasurementApplier [function, omicsObject]

applies a function to the measurement list of an omicsObject, ignoring missing values.

Applying a function to the measurements in an OmicsObject.

option name	default value	
ComponentIndex	All	ComponentIndex is an option for MathIOmica functions, such as Applier, that allows selection of which component of a list to use in an association or OmicsObject input or output values.
IgnorePattern	_Missing	IgnorePattern is an option for MeasurementApplier specifying a pattern of values to delete prior to applying the function to the measurement list.
ListIndex	1	ListIndex is an option for MathIOmica functions, such as Applier that allows selection of which list to use in the association or OmicsObject input or output values.

Options for MeasurementApplier.

We implement a Median calculation, and ignoring entries with missing and values of 1:

```
In[83]:= metaboliteMedians = MeasurementApplier[Median, metabolitesExample, IgnorePattern \rightarrow (_Missing | 1 | 1.)]
                \{ \{457.002, 0.34764, \text{Meta} \} \rightarrow \{ \{19880.5\}, \{ [C16 H11 N9 S4, db=0.00, \text{overall}=47.55, \text{mfg}=95.11], \} \},
                 ... 5962 ..., \{422.34, 14.7601, Meta\} \rightarrow \{\{69.828.\}, \{, \}\} \mid \rangle, .... 10 ...,
              20 \rightarrow \langle | \{457.002, 0.34764, Meta\} \rightarrow \{\{16606.5\}, \{...1...\}\}, ....5962..., \{...1...\} \rightarrow ....1... | \rangle | \rangle
             large output
                             show less
                                            show more
                                                             show all
                                                                           set size limit...
```

Data Power Transformation

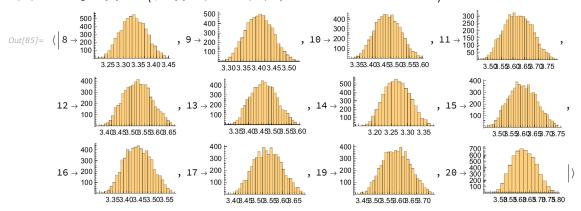

We apply a Box-Cox transformation to the metabolite median data in the OmicsObject, which is now the first list first component for each identifier. The optimized $\hat{\lambda}$ parameter for each sample is printed out for reference:

```
In[84]:= transformedMetaboliteData = ApplyBoxCoxTransform[metaboliteMedians, ListIndex \rightarrow 1, ComponentIndex \rightarrow 1]
          Calculated Box-Cox parameter \hat{\lambda} = -0.288857
          Calculated Box-Cox parameter \hat{\lambda} = -0.282374
          Calculated Box-Cox parameter \hat{\lambda} = -0.276202
          Calculated Box-Cox parameter \hat{\lambda} = -0.262075
          Calculated Box-Cox parameter \hat{\lambda} = -0.271308
          Calculated Box-Cox parameter \hat{\lambda} = -0.27703
          Calculated Box-Cox parameter \hat{\lambda} = -0.295395
          Calculated Box-Cox parameter \hat{\lambda} = -0.264833
          Calculated Box-Cox parameter \hat{\lambda} = -0.278556
          Calculated Box-Cox parameter \hat{\lambda} = -0.269513
          Calculated Box-Cox parameter \hat{\lambda} = -0.265784
          Calculated Box-Cox parameter \hat{\lambda} = -0.262769
```

```
⟨ | 8 →
   \{ \{457.002, 0.34764, Meta\} \rightarrow \{ \{3.26345\}, \{ [C16 H11 N9 S4, db=0.00, overall=47.55, mfg=95.11 ], \} \}, \}
    ...5962..., \{422.34, 14.7601, Meta\} \rightarrow \{\{3.32386\}, \{, \}\} \mid \rangle,
  \cdots 10 \cdots , 20 \rightarrow \langle {457.002, 0.34764, Meta} \rightarrow {\cdots 1\cdots}, \cdots 5962 \cdots, \cdots 1\cdots |\rangle |\rangle
                                                                  set size limit...
large output
                 show less
                                                    show all
                                  show more
```

We can plot the data to see what the resulting distributions look like:

In[85]:= Histogram[#] & /@ (Query[All, Values, 1, 1]@transformedMetaboliteData)

We may also wish to standardize the distributions:

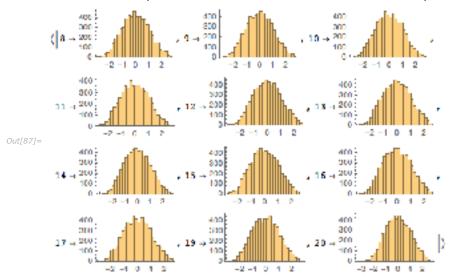

In[86]:= metabolitesStandardized =

Returner[transformedMetaboliteData, Applier[StandardizeExtended[#, Mean, StandardDeviation] &, transformedMetaboliteData, ListIndex \rightarrow 1, ComponentIndex \rightarrow 1], ListIndex \rightarrow 1, ComponentIndex \rightarrow 1]

```
⟨ | 8 →
                                                                                 \langle \; | \; \{457.002,\; 0.34764,\; \mathsf{Meta}\} \; \rightarrow \; \big\{ \; \{-1.71178\}, \; \big\{ \; \; [\; \mathsf{C16} \; \mathsf{H11} \; \mathsf{N9} \; \mathsf{S4}, \; \mathsf{db=0.00}, \; \mathsf{overall=47.55}, \; \mathsf{mfg=95.11} \; \; ] \; , \; \big\} \big\}, 
                                                                                         Out[86]=
                                                                           0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0.000, 0
                                                                                                                                                                                                                                                                                                       show all
                                                                                                                                                                                                                                                                                                                                                                      set size limit...
                                                                large output
                                                                                                                                                show less
                                                                                                                                                                                                                        show more
```

We can again plot the data to see what the standardized distributions look like:

In[87]:= Histogram[#] & /@ (Query[All, Values, 1, 1]@metabolitesStandardized)

Re-labeling Samples with Times

As with the transcriptome, we notice that the sample numberings do not correspond to actual days, so we may adjust using the sampleToDays association created above:

```
In[88]:= sampleToDays =
              <|"7" → "186", "8" → "255", "9" → "289", "10" → "290", "11" → "292", "12" → "294", "13" → "297", "14" → "301",</p>
               "15" \rightarrow "307", "16" \rightarrow "311", "17" \rightarrow "322", "18" \rightarrow "329", "19" \rightarrow "369", "20" \rightarrow "380", "21" \rightarrow "400" |>;
```

We can now do a KeyMap to rename the outer keys:

In[89]:= metabolitesLongitudinal = KeyMap[sampleToDays, metabolitesStandardized]

```
⟨ 255 →
      \langle \mid \{457.002, \ 0.34764, \ \mathsf{Meta}\} \rightarrow \big\{ \{-1.71178\}, \ \big\{ \ [ \ \mathsf{C16} \ \mathsf{H11} \ \mathsf{N9} \ \mathsf{S4}, \ \mathsf{db=0.00}, \ \mathsf{overall=47.55}, \ \mathsf{mfg=95.11} \ \big], \ \big\} \big\}, 
        ... 5962 ..., \{422.34, 14.7601, Meta\} \rightarrow \{\{-0.247328\}, \{, \}\} \mid \rangle,
    \underbrace{\quad \cdots \ 10 \ \cdots}, \ 380 \rightarrow \langle | \ \{457.002, \ 0.34764, \ \mathsf{Meta}\} \rightarrow \{\underbrace{\quad \cdots \ 1 \ \cdots}\}, \ \underbrace{\quad \cdots \ 5962 \ \cdots}, \ \underbrace{\quad \cdots \ 1 \ \cdots} | \rangle \ | \ \rangle 
large output
                            show less
                                                     show more
                                                                                  show all
                                                                                                        set size limit...
```

Now let's check the timepoints in this dataset:

```
In[90]:= timesMetaboliteRawData = TimeExtractor[metabolitesLongitudinal]
Out[90]= {255, 289, 290, 292, 294, 297, 301, 307, 311, 322, 369, 380}
```

We notice a complication: there are three timepoints missing, corresponding to the three samples for which we had indicated above that there were no measurements (compared to the transcriptome samples). These are samples on days "186", "329" and "400".

We can use the ConstantAssociator function to append these to the transformed data, tagging these data as Missing data:

```
In[91]:= metabolitesLongitudinalEnlarged =
        ConstantAssociator [metabolitesLongitudinal, <|"186" → Missing[], "329" → Missing[], "400" → Missing[]|>]
```

```
\langle | 255 \rightarrow
     \langle \mid \{457.002, \ 0.34764, \ \mathsf{Meta}\} \rightarrow \big\{ \{-1.71178\}, \ \big\{ \ [ \ \mathsf{C16} \ \mathsf{H11} \ \mathsf{N9} \ \mathsf{S4}, \ \mathsf{db=0.00}, \ \mathsf{overall=47.55}, \ \mathsf{mfg=95.11} \ \big], \ \big\} \big\}, 
      ... 5962 ..., \{422.34, 14.7601, Meta\} \rightarrow \{\{-0.247328\}, \{,\}\} \mid \rangle,
  ( ... 13 ... ), 400 → \langle | \{457.002, 0.34764, Meta \} \rightarrow ( ... 1 ... ), ( ... 5962 ... ), <math>( ... 1 ... ) \rangle | \rangle
large output
                       show less
                                                                                       set size limit...
                                             show more
                                                                    show all
```

We can now check the timepoints again:

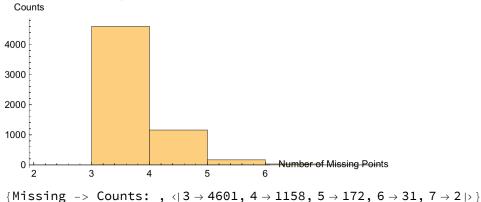

```
In[92]:= timesMetabolites = TimeExtractor[metabolitesLongitudinalEnlarged]
Out[92]= {186, 255, 289, 290, 292, 294, 297, 301, 307, 311, 322, 329, 369, 380, 400}
```

Filter Data

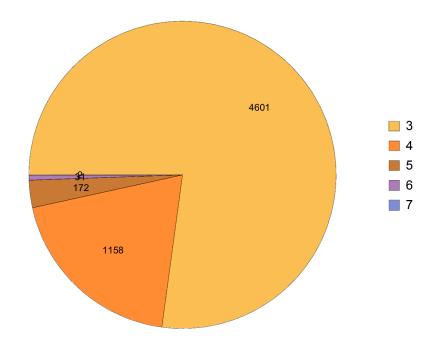

We will next remove values that have been tagged overall as Missing[], retaining data that have at least 3/4 data points available across all samples. Additionally we remove data where the reference healthy sample "255" was missing. We use the function FilterMissing for this implementation:

```
In/93]:= filteredMetaboliteData = FilterMissing[metabolitesLongitudinalEnlarged, 3/4, Reference → "255"]
```

Pie Chart of number of missing components

```
⟨ | 255 →
                     \langle \, \big| \, \{457.002, \, 0.34764, \, \text{Meta} \} \rightarrow \Big\{ \{-1.71178\}, \, \Big\{ \, \, [ \, \text{C16 H11 N9 S4, db=0.00, overall=47.55, mfg=95.11 } \, ] \,, \, \Big\} \Big\}, 
                      ....4599..., {406.381, 14.5609, Meta} →
Out[93]=
                        \{\{-1.34842\},\ \{2,4,6-\text{trimethyl}-2,15\dots\text{Lipid ID=, KEGG ID= }],\ \}\}\ \big|\ \rangle,\ \cdots\ 13\dots,\ 400 \rightarrow \langle|\ \cdots\ 1\dots\ |\ \rangle\ \big|\ \rangle
                large output
                                     show less
                                                       show more
                                                                            show all
                                                                                            set size limit...
```

Matching Unique Mass

We may want to match a unique mass to the metabolites. This is a putative mass identification based on the uniqueness of the mass feature. If matched, a KEGG compound identity can be prepended to the identifier using OmicsObjectUniqueMassConverter.

```
OmicsObjectUniqueMassConverter[
  omicsObject, massAccuracy]
```

assigns a unique putative mass identification to each of omicsObject's inner association keys, using the massAccuracy in parts per million.

Matching putative mass identifications to mass features in an <code>OmicsObject</code> of metabolites.

We match our identities to KEGG compound identifiers, using a 2ppm accuracy (this may take some time depending on the number of matching data):

```
In[94]:= massMatchedFilteredMetabolites = OmicsObjectUniqueMassConverter[filteredMetaboliteData, 2]
```

```
\langle | 255 \rightarrow
    \langle | \{457.002, 0.34764, \text{Meta} \} \rightarrow \{ \{-1.71178\}, \{ [ \text{C16 H11 N9 S4, db=0.00, overall=47.55, mfg=95.11 } ], \} \}
      \cdots 4599 \cdots , {406.381, 14.5609, Meta} \rightarrow
       \{\{-1.34842\}, \{2,4,6-\text{trimethyl}-2,15 \dots \text{Lipid ID=}, \text{KEGG ID=} \}, \}\} | \rangle, \dots | 3 \dots \rangle, 400 \rightarrow \langle | \dots | \dots | \rangle | \rangle
large output
                   show less
                                     show more
                                                         show all
                                                                         set size limit...
```

Create Metabolome Time Series

We can now create time series for each of the proteins.

For each metabolite feature we now extract a time series (list of values) corresponding to the set of times:

```
In/950:= timeSeriesMetabolites = CreateTimeSeries[massMatchedFilteredMetabolites]
```

```

Take Difference Compared to Reference in Metabolome Time Series.

Now we need to compare to compare the difference of each intensity for a given metabolite's time series to the intensity of the ratios of expression at any time point compared to a healthy datapoint. We can use the function SeriesInternalCompare:

We compare every value in each series to the healthy "255" time point, which is the second element in each series:

```
In[96]:= metabolitesCompared = SeriesInternalCompare[timeSeriesMetabolites, ComparisonIndex \rightarrow 2]
```

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 show more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           show all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         set size limit...
```

Finally, we use ConstantSeriesClean to remove constant series, as we are interested in changing time patterns:

```
Inf98?= metabolomeFinalTimeSeries = ConstantSeriesClean[normedMetabolitesCompared]
```

```

                                                                                                                                                                                                                                                                                                                                                                                                                      set size limit...
```

Resampling Metabolome Data

We also would like to create a resampled distribution for the metabolome dataset prior to classification and clustering. In this subsection we first resample the imported metabolome dataset. Then, we carry out the full analysis in this "bootstrap" dataset, to create a set of random metabolome time series. This bootstrap distribution of time series will be used to provide the cutoffs used in the time series classification in the following subsection.

Resampling the Proteome Data

We create a resampling of 100000 sets:

```
In[99]:= metabolitesBootstrap = BootstrapGeneral[metabolitesExample, 100 000]
```

```
\langle | 8 \rightarrow \langle | 1 \rightarrow \{ \{ 59123, 52730, 68584 \}, \} \}
                           {Benzoquinoneacetic acid [ C8 H6 O4, db=86.34, overall=43.17, HMP ID=HMDB02334, KEGG ID= ], }},
                        \cdots 99 998 \cdots , 100 000 \rightarrow { {76 318, 59 290, 44 033},
Out[99]=
                            \{ \texttt{16-phenyl-tetranor-PGE2} \ [ \ \texttt{C22} \ \dots \ \mathsf{id} \ \ \texttt{ID=LMFA03010066}, \ \ \mathsf{KEGG} \ \ \mathsf{ID=} \ ], \ \} \} \mid \rangle, \ \cdots \ \mathsf{10} \cdots , \ 20 \rightarrow \langle | \cdots \ \mathsf{1} \cdots | \rangle \mid \rangle \} 
                                      show less
                                                                               show all
                                                                                                 set size limit...
                 large output
                                                          show more
```

Processing the Bootstrap Metabolome and Creating Bootstrap Time Series

We implement a Median calculation, and ignoring entries with missing and values of 1 for the bootstrap set:

```
In[100]:= metaboliteBootstrapMedians =
                \texttt{MeasurementApplier} \big[ \texttt{Median, metabolitesBootstrap, IgnorePattern} \rightarrow \big( \underline{\texttt{Missing}} \mid 1 \mid 1. \big) \big];
```

We apply a Box-Cox transformation to the bootstrap metabolite median data in the OmicsObject, which is now the first list first component for each identifier. The optimized $\hat{\lambda}$ parameter for each sample is printed out for reference:

```
In[101]:= transformedBootstrapMetaboliteData =
         ApplyBoxCoxTransform[metaboliteBootstrapMedians, ListIndex → 1, ComponentIndex → 1]
```

```
Calculated Box-Cox parameter \hat{\lambda} = -0.288728
             Calculated Box-Cox parameter \hat{\lambda} = -0.279522
             Calculated Box-Cox parameter \hat{\lambda} = -0.276162
             Calculated Box-Cox parameter \hat{\lambda} = -0.26296
             Calculated Box-Cox parameter \hat{\lambda} = -0.269051
             Calculated Box-Cox parameter \hat{\lambda} = -0.277505
             Calculated Box-Cox parameter \hat{\lambda} = -0.294353
             Calculated Box-Cox parameter \hat{\lambda} = -0.264964
             Calculated Box-Cox parameter \hat{\lambda} = -0.280633
             Calculated Box-Cox parameter \hat{\lambda} = -0.268157
             Calculated Box-Cox parameter \hat{\lambda} = -0.267766
             Calculated Box-Cox parameter \hat{\lambda} = -0.260673
            < | 8 \rightarrow < | 1 \rightarrow \{ \{ 3.31833 \} \}, 
                  \{ \texttt{Benzoquinoneacetic acid} \ [ \ \texttt{C8 H6 O4, db=86.34, overall=43.17, HMP ID=HMDB02334, KEGG ID= } ] \ , \ \} \}, \\
               2 \rightarrow \{ \cdots 1 \cdots \}, \cdots 99996 \cdots, 99999 \rightarrow \cdots 1 \cdots, 100000 \rightarrow
                {{3.31845}, {16-phenyl-tetranor-PGE2 [ C22 ... d ID=LMFA03010066, KEGG ID= ], }} |>, ... 10...)
                                                            set size limit...
           large output
                         show less
                                     show more
                                                  show all
         We may also wish to standardize the distributions:
In[102]:= metabolitesBootstrapStandardized = Returner[transformedBootstrapMetaboliteData,
            Applier[StandardizeExtended[#, Mean, StandardDeviation] &, transformedBootstrapMetaboliteData,
             ListIndex \rightarrow 1, ComponentIndex \rightarrow 1, ListIndex \rightarrow 1, ComponentIndex \rightarrow 1
            < | 8 \rightarrow < | 1 \rightarrow \{ \{ -0.409196 \} , \}
                  {Benzoquinoneacetic acid [ C8 H6 O4, db=86.34, overall=43.17, HMP ID=HMDB02334, KEGG ID= ], }},
               2 \rightarrow \{ \cdots 1 \cdots \} , \cdots 99 996 \cdots , 99 999 \rightarrow \cdots 1 \cdots , 100 000 \rightarrow
                {{-0.406328}, {16-phenyl-tetranor-PGE2 [ C...ID=LMFA03010066, KEGG ID= ], }} |>, ...10...)
                         show less
                                                  show all
                                                            set size limit...
           large output
                                     show more
         We can now do a KeyMap to rename the outer keys with labels corresponding to days:
In[103]:= metabolitesBootstrapLongitudinal = KeyMap[sampleToDays, metabolitesBootstrapStandardized];
         Now let's check the timepoints in this dataset:
In[104]:= timesMetaboliteBootstrapData = TimeExtractor[metabolitesBootstrapLongitudinal]
Out[104]= {255, 289, 290, 292, 294, 297, 301, 307, 311, 322, 369, 380}
         We can use the ConstantAssociator function to append the "186", "329" and "400" missing days to the transformed
         bootstrap data:
```

metabolitesBootstrapLongitudinal, <|"186" → Missing[], "329" → Missing[], "400" → Missing[]|>];

Inf105]:= metabolitesBootstrapLongitudinalEnlarged = ConstantAssociator[

We can now check the timepoints again:

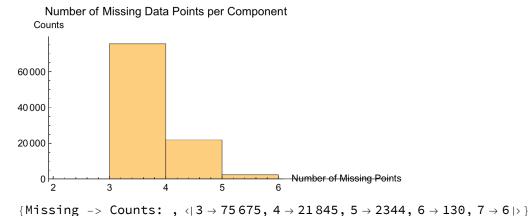

In[106]:= timesMetabolitesBootstrap = TimeExtractor[metabolitesBootstrapLongitudinalEnlarged]

 $Out[106] = \{186, 255, 289, 290, 292, 294, 297, 301, 307, 311, 322, 329, 369, 380, 400\}$

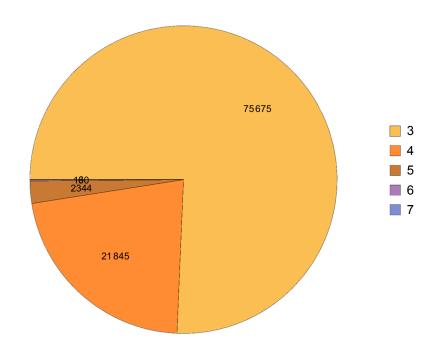

We next remove values that have been tagged overall as Missing[], retaining data that have at least 3/4 data points available across all samples. Additionally we remove data where the reference healthy sample "255" was missing. We use the function FilterMissing for this implementation:

In[107]:= filteredMetaboliteBootstrapData =

 $Filter \texttt{Missing} \big[\texttt{metabolites} \texttt{BootstrapLongitudinalEnlarged}, \texttt{3/4}, \texttt{Reference} \rightarrow \texttt{"255"} \big] ;$

Pie Chart of number of missing components

For each bootstrap metabolite feature we now extract a time series (list of values) corresponding to the set of times:

In[108]:= timeSeriesMetabolitesBootstrap = CreateTimeSeries[filteredMetaboliteBootstrapData];

```
We compare every value in each bootstrap series to the healthy "255" time point, which is the second element in each series:
In[109]:= metabolitesBootstrapCompared = SeriesInternalCompare[timeSeriesMetabolitesBootstrap, ComparisonIndex 
ightarrow 2];
         Next, we normalize each series, using again SeriesApplier:
In[110]:= normedMetabolitesBootstrapCompared = SeriesApplier[Normalize, metabolitesBootstrapCompared];
         Finally, we use ConstantSeriesClean to remove constant series, as we are interested in changing time patterns:
In/I11]:= metabolomeBootstrapFinalTimeSeries = ConstantSeriesClean[normedMetabolitesBootstrapCompared];
```

Classification of Metabolome Time Series

In this subsection we will classify the meetabolome time series based on patterns in the series. For the classification we will use TimeSeriesClassification. We will use QuantileEstimator for the "LombScargle" method to provide a cutoff for the TimeSeriesClassification inputs.

```
First, we estimate for the "LombScargle" Method, 0.95 quantile cutoff from the bootstrap metabolome data:
In/[112]:= q95Metabolites = QuantileEstimator[metabolomeBootstrapFinalTimeSeries, timesMetabolitesBootstrap]
Out[112]= 0.846716
          Next, we estimate the "Spikes" 0.95 quantile cutoff from the bootstrap proteome data:
In[113]:= q95MetabolitesSpikes =
           QuantileEstimator[metabolomeBootstrapFinalTimeSeries, timesMetabolitesBootstrap, Method → "Spikes"]
Out[113] = \langle | 12 \rightarrow \{0.669189, -0.651331\} | \rangle
          Now we can classify the proteome time series data based on these cutoffs:
In[114]:= metaboliteClassification = TimeSeriesClassification[metabolomeFinalTimeSeries,
            timesMetabolites, LombScargleCutoff → q95Metabolites, SpikeCutoffs → q95MetabolitesSpikes]
             Method → "LombScargle"
            <| SpikeMax →
              \{1514.1, 0.366235, \text{Meta}\} \rightarrow \{\{0.150094, 0.150759, 0.336515, 0.197558, 0.430385, 0.667846, 0.41379\}, \}
Out[114]=
                  \{Missing[], 0., \dots 12 \dots, Missing[]\}\}, \dots 138 \dots, \{\dots 1 \dots\} \rightarrow \dots 1 \dots | \rangle, \dots 6 \dots | \rangle
                                                   show all
                                                              set size limit...
           large output
                         show less
                                     show more
```

As discussed above, the default output for TimeSeriesClassification is an Association with outer keys being the classification classes, inner keys being the class members, and each class member value being a list of {{computed classification vector}, {input data list}}.

If we want the classes produced, we can query the keys:

```
In[115]:= Keys[metaboliteClassification]
Out[115]= {SpikeMax, SpikeMin, f1, f2, f5, f6, f7}
```

For the number of members in each class we have:

```
In[116]:= Query[All, Length]@metaboliteClassification
Out[116]= \langle | SpikeMax \rightarrow 140, SpikeMin \rightarrow 717, f1 \rightarrow 62, f2 \rightarrow 38, f5 \rightarrow 43, f6 \rightarrow 14, f7 \rightarrow 33 | \rangle
```

We can obtain the membership list in any class of interest:

```
In[117]:= Query["f1", Keys]@metaboliteClassification
\textit{Out[117]} = \{\{373.859, 0.411324, \texttt{Meta}\}, \{\texttt{cpd:C11821}, 184.024, 0.653444, \texttt{Meta}\}, \{221.109, 10.3062, \texttt{Meta}\}, \{\texttt{cpd:C11821}, 184.024, 0.653444, \texttt{Meta}\}, \{\texttt{cpd:C11821}, \texttt{meta}\}, \{\texttt{cpd:C
                                        {cpd:C18218, 272.235, 12.7737, Meta}, {294.166, 13.0495, Meta}, {631.385, 13.5221, Meta},
                                        {563.32, 13.7008, Meta}, {779.604, 13.9622, Meta}, {362.266, 14.001, Meta},
                                        {cpd:C17873, 384.36, 14.2982, Meta}, {390.297, 14.3592, Meta}, {420.361, 14.6658, Meta},
                                        {434.376, 14.7796, Meta}, {392.366, 15.0173, Meta}, {394.381, 15.1519, Meta}, {1599.15, 15.281, Meta},
                                       {693.628, 15.6921, Meta}, {874.715, 15.9118, Meta}, {281.986, 0.390455, Meta}, {504.309, 14.3911, Meta},
                                        {416.313, 14.4627, Meta}, {735.521, 15.1792, Meta}, {571.961, 0.388167, Meta}, {489.958, 0.388912, Meta},
                                       {325.95, 0.392472, Meta}, {465.913, 0.393056, Meta}, {383.909, 0.397722, Meta},
                                        {301.906, 0.407861, Meta}, {219.903, 0.412111, Meta}, {161.944, 0.413086, Meta},
                                         \{139.061,\, 0.458472,\, \text{Meta}\},\, \{115.064,\, 0.463972,\, \text{Meta}\},\, \{71.074,\, 0.482559,\, \text{Meta}\},\, \{253.165,\, 9.12729,\, \text{Meta}\},\, \{110.064,\, 0.463972,\, \text{Meta}\},\, \{110.064,\, 0.46392,\, \text{Meta}\},\, \{110.064,\, 0.46392,\,
                                        {298.132, 9.30967, Meta}, {cpd:C20605, 411.179, 9.3167, Meta}, {440.201, 11.2909, Meta},
                                       {355.218, 12.7443, Meta}, {1061.15, 13.0612, Meta}, {210.198, 13.1613, Meta}, {501.367, 13.296, Meta},
                                       {594.375, 13.3701, Meta}, {1538.03, 13.3796, Meta}, {404.314, 13.6028, Meta}, {692.323, 13.7652, Meta},
                                        {670.265, 13.8732, Meta}, {814.584, 14.1513, Meta}, {366.349, 14.3015, Meta}, {442.402, 14.3568, Meta},
                                        {406.381, 14.3581, Meta}, {278.152, 14.364, Meta}, {cpd:C19658, 344.271, 14.4331, Meta},
                                        {420.358, 14.4446, Meta}, {311.319, 14.6119, Meta}, {791.583, 15.4236, Meta}, {1553.18, 15.4429, Meta},
                                        {1545.17, 15.5017, Meta}, {352.052, 0.53368, Meta}, {cpd:C17237, 254.073, 12.2926, Meta},
                                        {336.228, 12.5103, Meta}, {638.402, 13.4139, Meta}, {668.324, 13.988, Meta}}
```

To obtain the possible frequencies we simply run LombScargle over the desired times for one of the time series and set the FrequenciesOnly option to True:

```
In[118]:= LombScargle[metabolomeFinalTimeSeries[[1]], timesMetabolites, FrequenciesOnly → True]
Out[118] = \langle | f1 \rightarrow 0.00500668, f2 \rightarrow 0.0104306, f3 \rightarrow 0.0158545,
              f4 \rightarrow 0.0212784, f5 \rightarrow 0.0267023, f6 \rightarrow 0.0321262, f7 \rightarrow 0.0375501 \big| \, \big\rangle
```

Combined Data Clustering

In this section we will combine the omics data classes from the individual classifications above using JoinNestedAssociations and hierarchically cluster the information to obtain a second level of classification using TimeSeriesClusters. We will visualize the results in the following section.

Combining Multi-omics Classifed Data

JoinNestedAssociations [associationList]

merges the nested associationList (an association of associations) by joining the inner associations for each matching key.

Joining classification data.

We combine the classification data using JoinNestedAssociations:

```
In[119]:= combinedClassification =
         JoinNestedAssociations [{rnaClassification, proteinClassification, metaboliteClassification}]
```

```
<| SpikeMax →
    \dashv \{ \texttt{LOC100132287, RNA} \} \rightarrow \{ \{ \texttt{0.0915681, 0.545226, 0.0943158, 0.512412, 0.115633, 0.239286, 0.59351} \}, 
       \{0.797569, 0., -11..., 0., 0.\}\}, -846..., \{-1...\} \rightarrow -1...|\rangle, -8...|\rangle
large output
                show less
                              show more
                                              show all
                                                           set size limit...
```

We can check the keys before and after the combination:

```
In[120]:= Keys[#] & /@ {rnaClassification, proteinClassification, metaboliteClassification }
Out[120]= {{SpikeMax, SpikeMin, f1, f2, f3, f4, f5, f6, f7},
          {SpikeMax, SpikeMin, f1, f5, f6, f7}, {SpikeMax, SpikeMin, f1, f2, f5, f6, f7}}
In[121]:= Keys@combinedClassification
Out[121]= {SpikeMax, SpikeMin, f1, f2, f3, f4, f5, f6, f7}
```

We can also check the membership counts before and after the combination:

```
In[122]:= Query[All, Length]@#&/@{rnaClassification, proteinClassification, metaboliteClassification}
\textit{Out[122]} = \left\{ \langle | \text{SpikeMax} \rightarrow 600, \text{SpikeMin} \rightarrow 8507, \text{ } f1 \rightarrow 58, \text{ } f2 \rightarrow 3, \text{ } f3 \rightarrow 13, \text{ } f4 \rightarrow 40, \text{ } f5 \rightarrow 14, \text{ } f6 \rightarrow 10, \text{ } f7 \rightarrow 56 | \rangle, \text{ } f1 \rightarrow 58, \text{ } f2 \rightarrow 3, \text{ } f3 \rightarrow 13, \text{ } f4 \rightarrow 40, \text{ } f5 \rightarrow 14, \text{ } f6 \rightarrow 10, \text{ } f7 \rightarrow 56 | \rangle, \text{ } f1 \rightarrow 58, \text{ } f2 \rightarrow 3, \text{ } f3 \rightarrow 13, \text{ } f4 \rightarrow 40, \text{ } f5 \rightarrow 14, \text{ } f6 \rightarrow 10, \text{ } f7 \rightarrow 56 | \rangle, \text{ } f1 \rightarrow 58, \text{ } f2 \rightarrow 3, \text{ } f3 \rightarrow 13, \text{ } f4 \rightarrow 40, \text{ } f5 \rightarrow 14, \text{ } f6 \rightarrow 10, \text{ } f7 \rightarrow 56 | \rangle, \text{ } f1 \rightarrow 58, \text{ } f2 \rightarrow 3, \text{ } f3 \rightarrow 13, \text{ } f4 \rightarrow 40, \text{ } f5 \rightarrow 14, \text{ } f6 \rightarrow 10, \text{ } f7 \rightarrow 56 | \rangle, \text{ } f1 \rightarrow 58, \text{ } f2 \rightarrow 3, \text{ } f3 \rightarrow 13, \text{ } f4 \rightarrow 40, \text{ } f5 \rightarrow 14, \text{ } f6 \rightarrow 10, \text{ } f7 \rightarrow 56 | \rangle, \text{ } f1 \rightarrow 58, \text{ } f2 \rightarrow 3, \text{ } f3 \rightarrow 13, \text{ } f4 \rightarrow 40, \text{ } f5 \rightarrow 14, \text{ } f6 \rightarrow 10, \text{ } f7 \rightarrow 56 | \rangle, \text{ } f1 \rightarrow 10, \text{ } f2 \rightarrow 10, \text{ } f1 \rightarrow 10, \text{ } f2 \rightarrow 10, \text{ 
                                                                                                 \langle\,\big|\,\text{SpikeMax} \to \text{108, SpikeMin} \to \text{75, f1} \to \text{76, f5} \to \text{6, f6} \to \text{36, f7} \to \text{18}\,\big|\,\rangle\,,
                                                                                                 \langle \, \big| \, \texttt{SpikeMax} \rightarrow \texttt{140, SpikeMin} \rightarrow \texttt{717, f1} \rightarrow \texttt{62, f2} \rightarrow \texttt{38, f5} \rightarrow \texttt{43, f6} \rightarrow \texttt{14, f7} \rightarrow \texttt{33} \, \big| \, \rangle \, \big\}
In[123]:= Query[All, Length]@combinedClassification
\textit{Out[123]= } \langle \left| \text{SpikeMax} \rightarrow 848, \text{SpikeMin} \rightarrow 9299, \text{ } f1 \rightarrow 196, \text{ } f2 \rightarrow 41, \text{ } f3 \rightarrow 13, \text{ } f4 \rightarrow 40, \text{ } f5 \rightarrow 63, \text{ } f6 \rightarrow 60, \text{ } f7 \rightarrow 107 \right| \rangle
```

Clustering of Classified Data

Now that we have combined the classes for the various omics, we can cluster them together to obtain the various trends using TimeSeriesClusters. A two-tier hierarchical clustering of the data is performed, using a set of two classification vectors, $\{\{classification vector_1\}, \{classification vector_2\}\}$ for each time series to cluster the data pairwise. The vectors are typically the output from TimeSeriesClassification. Similarities at each clustering tier are then computed using in succession from each time series first {classification vector₁}, and subsequently {classification vector₂} (which corresponds to the {input data time series} if the input is from TimeSeriesClassification).

The number of groups and subgroups for each tier of clustering is automatically determinded by using internally the "Silhouette" (default) or "Gap" as "SignificanceTest" methods (see also Partitioning Data into Clusters).

TimeSeriesClusters [data]

performs clustering of time series data using two tiers of hierarchical clustering to identify groups and subgroups in the data. TimeSeriesClusters takes as input series data, where each data is comprised of two lists and performs clustering of the data to identify groups and subgroups based on similarities between the input series. The form of the input data is either an association of classes and members, where each member must have a list of two components, typically two vectors used in classification:

 $\{\{classification\ vector_1\},\ \{classification\ vector_2\}\}.$ In the most common case of using as input data that came from performing a TimeSeriesClassification, the

 $\{classification\ vector_2\}\ will\ correspond\ to\ input\ original\ data\ for$ the corresponding time series.

Clustering of classified time series.

option name	default value	
ClusterLabeling	1111	Additional label to append to each cluster being computed to prepend to the inbuilt G#S# labeling.
DendrogramPlotOptions	{}	Options passed to the DendrogramPlot function used internally to generate the dendrograms.
DistanceFunction	EuclideanDistance	Distance function to be used in calculating the similarities between different time series in the first tier of clustering.
LinkageMeasure	"Average"	Which linkage measure to use in computing fusion coefficients.
PrintDendrograms	False	Option to print dendrograms for the clustering computed.
ReturnDendrograms	False	Option to return the dendrograms as output.
SignificanceCriterion	"Silhouette"	Method used in determining the number of groups and subgroups at each tier of clustering.
SingleAssociationLabel	"1"	Label to use in case a list is provided to name the class of data produced.
SubclusteringDistanceFunction	EuclideanDistance	Distance function to be used in calculating the similarities between different time series in the second tier of clustering.

Options for TimeSeriesClusters.

The output of TimeSeriesClusters is always an association of associations, providing a summary of the two tier clustering results for each class provided in the input. The output has the form:

```
output =
  < \mid Class<sub>1</sub> \rightarrow < \mid "Cluster" \rightarrow cluster object<sub>1</sub>,
       \verb|"InitialSplitCluster"| \to \{ \verb|InitialSplitCluster"|_1, \verb|| InitialSplitCluster"|_2 \dots \},
       "IntermediateClusters" \rightarrow {IntermediateCluster<sub>11</sub>, IntermediateCluster<sub>12</sub>...},
       \verb"SubsplitClusters" \rightarrow \ \{ \{ SubsplitClusters_{11} \} \ \{ SubsplitClusters_{12} \} \} \text{,}
       "Data" \rightarrow \{\{\text{input data vector}_{11}\} \rightarrow \text{Member}_{11}, \ldots, \},
       "GroupAssociations" \rightarrow < | "G1S1" \rightarrow \{ \text{member list G1S1} \} ,
           "G1S2" → {member list for G1S2},
          "G2S1" \rightarrow { ...} | > | >,
   Class_2 \rightarrow < | "Cluster" \rightarrow cluster object,
       "InitialSplitCluster" → {InitialSplitCluster<sub>21</sub>, InitialSplitCluster<sub>22</sub>...},
       "IntermediateClusters" \rightarrow {IntermediateCluster<sub>21</sub>, IntermediateCluster<sub>22</sub>...},
       \verb"SubsplitClusters" \rightarrow \ \{ \{ SubsplitClusters_{21} \} \ \{ SubsplitClusters_{22} \} \} \ ,
       "Data" \rightarrow { {input data vector<sub>21</sub>} \rightarrow Member<sub>21</sub>, ...,},
       "GroupAssociations" \rightarrow < | "G1S1" \rightarrow {member list G1S1} ,
           "G1S2" \rightarrow {member list for G1S2},
           "G2S1" \rightarrow { ...} | > | >,
   Class_{M} \rightarrow < | "Cluster" \rightarrow cluster object<sub>M</sub>,
       "Initial Split Cluster" \rightarrow \ \{Initial Split Cluster_{\texttt{M1}}, \ Initial Split Cluster_{\texttt{M2}} \dots \},
       "IntermediateClusters" \rightarrow {IntermediateCluster<sub>M1</sub>, IntermediateCluster<sub>M2</sub>...},
       "SubsplitClusters" \rightarrow \ \{ \{ subsplitClusters_{\texttt{M1}} \} \ \{ subsplitClusters_{\texttt{M2}} \} \} \ ,
       "Data" \rightarrow { {input data vector<sub>M1</sub>} \rightarrow Member<sub>M1</sub>, ...,},
       "GroupAssociations" \rightarrow < | "G1S1" \rightarrow \{ \text{member list G1S1} \} ,
           "G1S2" → {member list for G1S2},
          "G2S1" \rightarrow { ...} | > |
  |>
```

Method	Description
"Cluster"	Cluster generated using the input $\{\mbox{classification vector}_1\}$ for similarity calculations.
"InitialSplitCluster"	Clusters resulting from splitting the initial cluster (reported by key "Cluster") into groups using the SignificanceCriterion to determine the number of clusters.
"IntermediateClusters"	Aglomerative clustering result of hierarchical clustering of each of the initial split clusters (reported by "InitialSplitCluster")
"SubsplitClusters"	Custers generated from splitting the clusters following the second tier clustering (reported by "IntermediateClusters") into subgroups using the SignificanceCriterion to determine the number of clusters.
"Data"	Data reported in the order of clustering results as rules of $\{classification\ vector_2\} \rightarrow label$ for each time series, sorted in order of the clustering results.
"GroupAssociations"	Association denoting membership of each initial data label to groups and subgroups generated by the two tier clustering.

Output keys for TimeSeriesClusters provide clustering information.

We now cluster our combined data (a printout of the clusters is included as a default option):

In[124]:= combinedClusters = TimeSeriesClusters[combinedClassification]

Agglomerate::ties: 226 ties have been detected; reordering input may produce a different result. >>

Agglomerate::ties: 1 ties have been detected; reordering input may produce a different result. >>

Agglomerate::ties: 1 ties have been detected; reordering input may produce a different result. >>

General::stop: Further output of Agglomerate::ties will be suppressed during this calculation. >>

```
\langle | SpikeMax \rightarrow \langle | Cluster \rightarrow Cluster[Cluster[Cluster[...], ...], 19],
       Cluster[Cluster[Cluster[...], Cluster[...], 0.735647, 142, 183], ....3..., 110],
       0.795876, 153, 435], Cluster[....], ....19..., 588, 260], ....4..., ....1....|>, ....8...|>
                                                  set size limit...
large output
             show less
                          show more
                                       show all
```

Visualization

After our data have been clustered, we would like to visuzlie the results in heatmaps and dendrograms. For the two-tier clustering we have performed MathIOmica can output all the clusterings in labeled dendrograms and heatmaps using TimeSeriesDendrogramsHeatmaps, which iteratively calls TimeSeriesDendrogramHeatmap on each class.

TimeSeriesDendrogramsHeatmaps [data] generates dendrograms and associated heatmap plots for clustered time series data, typically the output of all classes generated by implementing TimeSeriesClusters. TimeSeriesDendrogramHeatmap [data] generates a dendrogram and heatmap plot for one set of time series data clusters, typically the output of a single class of TimeSeriesClusters.

Visualizing the results of classification.

otion name	default value	
nctionOptions	{ImageSize -> 200}	Options list passed to the internal TimeSeriesDendrogramHeatmap function.

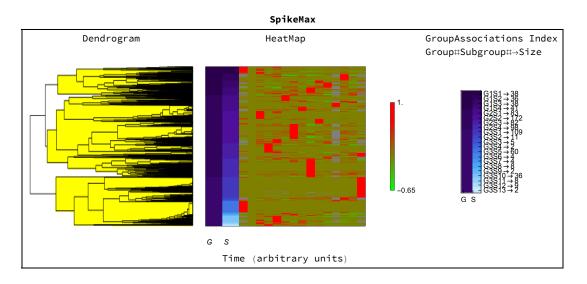

Options for TimeSeriesDendrogramsHeatmaps.

option name	default value	
ColorBlending	{CMYKColor[1, 0, 1, 0], CMYKColor[0, 1, 1, 0]}	Color scheme for the plot. The color list is passed to an internal Blend function to create a ColorFunction for an internal ArrayPlot function .
DendrogramColor	RGBColor[1, 1, 0]	Color to highlight the dendrograms.
FrameName	"Dendrogram and Heatmap"	Label for plot frame.
GroupSubSize	{0.1, 0.1}	Relative size of group and subgroup reference column in plot.
HorizontalAxisName	"Time (arbitrary units)"	Label for the horizontal heatmap axis.
HorizontalLabels	None	Labels for horizontal axis for each column.
IndexColor	"DeepSeaColors"	Choice of color for labeling the group/subgroup index.
ImageSize	200	ImageSize is an option that specifies the overall size of an image to display for an object.
ScaleShift	None	Option to reset the blend of the colors used overall. The option is a real positive number, and is used as a multiplier for an internal Blend function's second argument.
VerticalLabels	None	Labels for vertical axis for each row.

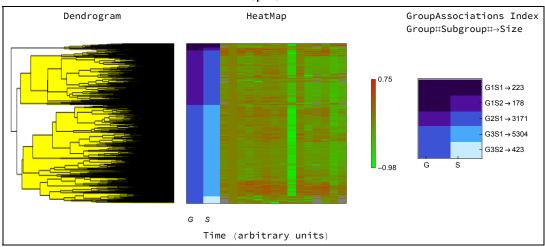

Options for TimeSeriesDendrogramHeatmap.

For each class a separate plot is generated: dendrograms are represented on the left, and are highlighted to represent the grouping level. The G, S, columns represent the groupings and subgroupings generated by the clustering. The legend shows the corresponding groupings and subgrouping, and the number of elements in each group subgroup.

Annotation and Enrichment

Having carried out the classification and clustering of data base on its temporal pattern, we would like to perform annotation of these data for gene ontology (GO) and pathways from KEGG: Kyoto Encyclopedia of Genes and Genomes.

Gene Ontology Analysis

MathIOmica provides a GOAnalysis function using annotations (default is for human data) obtained from the Gene Ontology consortium, and by default uses human data annotated with UniProt IDs. The GOAnalysis function performs an overrepresentation (ORA) analysis, providing a "significance" cutoff based on a p-value assessed by a hypergeometric function.

GOAnalysis [data]

calculates input data over–representation analysis (ORA) for Gene Ontology (GO) categories. We note that the function utilizes ontologies obtained from the GO Consortium, and by default uses human data annotated with UniProt IDs.

Performing an over representation analysis for Gene Ontology (GO) terms, using clustered data in MathIOmica.

option name	default value	
AdditionalFilter	None	AdditionalFilter provides additional filtering that may be applied to the standard output structure to be returned.
AugmentDictionary	True	AugmentDictionary provides a choice whether or not to augment the current ConstantGeneDictionary variable or create a new one.
BackgroundSet	All	BackgroundSet provides a list of IDs (e.g. gene accessions) that should be considered as the background for the calculation.
FilterSignificant	True	FilterSignificant can be set to True to filter data based on whether the enrichment analysis is statistically significant, or if set to False to return all membership computations.
GeneDictionary	None	GeneDictionary points to an existing variable to use as a gene dictionary in annotations. If set to None the default ConstantGeneDictionary will be used.
GetGeneDictionaryOptions	{}	The GetGeneDictionaryOptions option specifies a list of options that will be passed to the internal GetGeneDictionary function.
GOAnalysisAssignerOptions	{}	The GOAnalysisAssignerOptions option specifies a list of options that will be passed to the internal GOAnalysisAssigner function.
HypothesisFunction	(Query["Results"][BenjaminiHo- chbergFDR[The HypothesisFunction option allows us to chose a function to implement multiple hypothesis testing. The default is using the BenjaminiHochbergFDR function. The user can use any function f with three inputs, of the form f[#1,#2,#3] where the inputs refer to: #1 is the p-value list, #2 is a significance cutoff, #3 is the number of GO associations overall being tested. The function f must output a list of 3 values: {original p-value, adjusted p-value, True or False based on whether this value is considered statistically significant or not respectively}.
InputID	{"UniProt ID", "Gene Symbol"}	The InputID option specifies the kind of identifiers/a cessions used as input.

The Species option specifies the species considered

in the calculation.

                                                                                                                                                                                                        #3 is total number of members in population,
                                                                                                                                                                                                        #4 is number of successes (or more) in current
                                                                                                                                                                                                        group being tested for specific category.
                                                                                                                                                                                                         The output is a p-value (real positive number \leq 1).
```

Options for GOAnalysis.

The input data for GOAnalysis be a single list of n genes in the form:

```
data = {ID_1, ID_2, ..., ID_n}
```

The IDs may be provided as ID strings, or as labeled strings in the case of multiple omics being considered. Labeled IDs are provided as $\{\{ID_1, label_1\}, \{ID_2, label_2\}, \dots \{ID_3, label_2\}\}$. The labels are typically a string, e.g. typically "RNA" or "Protein".

The default output contains each GO:term that was considered and found to be statistically significant. For each GO term schematically have association with we an keys GO: Term → {{testing outcomes}, {statistics}, {{GO term}, {Membership}}}. The output has the following structures: for a single list input:

```
listOutput = < |
  GO: Term_1 \rightarrow \{\{p - value_1, multiple \text{ hypothesis adjusted } p - value_1, True / False for statistical significance\},
      \{\{\text{number of members in group being tested, number of successes for term}_1 \text{ in population, total number of} \}
          members in population, number of members (or more) in current group being tested associated to term<sub>1</sub>},
       \{\{\text{GO term}_1 \text{ description, ontology category for } \text{term}_1\}, \{\text{input IDs associated to } \text{Term}_1\}\}\}\},
   \texttt{G0:Term}_2 \rightarrow \{ \{ p - value_2, \, multiple \, \text{hypothesis adjusted} \, p - value_2, \, True \, / \, \\ \texttt{False for statistical significance} \}, 
      {{number of members in group being tested, number of successes for term₂ in population, total number of
          members in population, number of members (or more) in current group being tested associated to term<sub>2</sub>},
       \{\{GO \text{ term}_2 \text{ description, ontology category for term}_2\}, \{input IDs \text{ associated to Term}_2\}\}\}\}, \ldots,
  GO: Term<sub>n</sub> → {{p - value<sub>n</sub>, multiple hypothesis adjusted p - value<sub>n</sub>, True / False for statistical significance},
      {{number of members in group being tested, number of successes for term, in population, total number of
          members in population, number of members (or more) in current group being tested associated to term_n,
       \{\{GO \text{ term}_n \text{ description, ontology category for } term_n\}, \{input IDs \text{ associated to } term_n\}\}\}\}
 |>
```

GOAnalysis can also take as input the output of clustering of time series classification data, e.g. TimeSeriesClusters or TimeSeriesSingleClusters association of associations. The groups for each class will then have keys labeled "GroupAssociations", that include the labels used in the clustering. The labels must correspond to protein or gene accessions/IDs. For each class and group the corresponding GOAnalysis enrichment is computed and returned.

We also note that GOAnalysis provides a multiple-hypothesis adjusted p-value. By default, it utilizes a Benjamini-Hochberg false discovery rate (FDR) using BenjaminiHochbergFDR.

```
BenjaminiHochbergFDR [pValues]
```

calculates for a list of *pValues*, $\{p_1, p_2, \ldots, p_N\}$, the Benjamini Hochberg approach false discovery rates (FDR).

Calculating a false discovery rate (FDR).

We carry out our GOAnalysis for all the classes and groups/subgroups. We only report terms for which there are at least 3 members, and additionally correct for multiple omics (2 sets of GO terms, one each for proteomics and transcriptomics). Please note that this is a time consuming computation.

```
In[126]:= goAnalysisCombined = GOAnalysis[combinedClusters, OntologyLengthFilter\rightarrow 3,
            ReportFilter → 3, MultipleList → True, MultipleListCorrection → 2];
```

We see that the classification is maintained:

```
In[127]:= Keys@goAnalysisCombined
Out[127]= {SpikeMax, SpikeMin, f1, f2, f3, f4, f5, f6, f7}
```

Let us extract the top 3 results from all the "SpikeMax" data:

```
In[128]:= Query["SpikeMax", All, 1;; 3]@goAnalysisCombined
Out[128]= \langle | G1S1 \rightarrow
                                       \langle | 60:0006351 \rightarrow \{ \{ 1.44719 \times 10^{-6}, 0.000256153, True \}, \{ 25, 4570, 94482, 9 \}, \{ \{ transcription, DNA-templated, 1.44719 \times 10^{-6}, 0.000256153, True \}, \{ 25, 4570, 94482, 9 \}, \{ \{ transcription, DNA-templated, 1.44719 \times 10^{-6}, 0.000256153, True \}, \{ 1.44719 \times 10^{-6}, 0.000256153, True \}, \{ 25, 4570, 94482, 9 \}, \{ \{ transcription, DNA-templated, 1.44719 \times 10^{-6}, 0.000256153, True \}, \{ 1.44719

Pathway Analysis

Enrichment of Genomic KEGG Pathways (KEGG: Kyoto Encyclopedia of Genes and Genomes)

MathIOmica provides a KEGGAnalysis function using annotations (default is for human data) obtained from KEGG: Kyoto Encyclopedia of Genes and Genomes, and by default uses human data annotated with KEGG Gene IDs. The KEGGAnalysis function performs an over-representation (ORA) analysis, providing a "significance" cutoff based on a p-value assessed by a hypergeometric function.

 $G0:0006457 \rightarrow \{0.0164626, 0.0495234, True\}, G0:0005794 \rightarrow \{0.0164904, 0.0495234, True\} | \}$

KEGGAnalysis[data] calculates input data over-representation analysis for KEGG: Kyoto Encyclopedia of Genes and Genomes pathways. We note that the function utilizes data obtained from the KEGG databases, and by default uses human data annotated by "KEGG Gene ID".

option name default value

Performing an over representation analysis for KEGG:Kyoto Encyclopedia of Genes and Genenomes pathways, using clustered data in MathIOmica.

PathwayLengthFilter	2	PathwayLengthFilter can be used to set the value for which terms to consider in the computation, by excluding KEGG pathways that have fewer items compared to the PathwayLengthFilter value. It is used by the internal KEGGAnalysisAssigner function.
pValueCutoff	0.05	pValueCutoff provides a cutoff p-value for adjusted p-values to assess statistical significance.
ReportFilter	1	ReportFilter provides a cutoff for membership in pathways in selecting which terms/pathways to return. It is used in conjunction with ReportFilterFunction.
ReportFilterFunction	GreaterEqualThan	ReportFilterFunction specifies what operator form will be used to compare against ReportFilter option value in selecting which terms/pathways to return. The default is to use GreaterEqualThan
Species	"human"	The Species option specifies the species considered in the calculation.
TestFunction	N[1 - CDF[HypergeometricDistribution[#1, #2, #3], #4 - 1]] &	

Options for KEGGAnalysis.

The input data can be a single list of n genes in the form:

```
data = {ID_1, ID_2, ..., ID_n}
```

The IDs may be provided as ID strings, ID; (e.g. "NFKB1") as strings enclosed in list brackets {ID;}, (e.g. {"NFKB1"} or as labeled strings in the case of multiple omics being considered. Labeled IDs are typically provided as:

```
\{\{ID_1, \ldots optional \ label \ items_1, \ label_1\},\
    \{\mathtt{ID}_2,\ \dots \mathsf{optional}\ \mathsf{labelitems}_2,\ \dots,\ \mathsf{label}_2\},\ \dots \{\mathtt{ID}_n,\ \dots,\ \mathsf{optional}\ \mathsf{labelitems}_n,\ \dots,\ \mathsf{label}_n\}\}.
```

The ID labels are typically a string, e.g. typically "RNA" or "Protein", (e.g. {"NFKB1", "Protein"}) or for a molecular ID obtained from metabolomics experiments, can also contain other optional label items such as mass and retention time {"cpd:C00449", 276.133, 11.0041, "Meta"}. The main label must always be the last element in the list.

The output has the following structures: for a single list input:

```
listOutput = < | KEGG : pathway_1 \rightarrow
    \{\{p - value_1, multiple \ hypothesis \ adjusted \ p - value_1, \ True / False \ for statistical \ significance\},
      \{ \{ \text{number of members in group being tested, number of successes for term}_1 \text{ in population, } \} 
         total number of members in population, number of members (or more) in current group being tested
          associated \ to \ pathway_1\}, \ \{\texttt{KEGG} \ pathway_1 \ description}, \ \{\texttt{input IDs} \ associated \ to \ pathway_1\}\}\}\}\},
  KEGG: pathway<sub>2</sub> \rightarrow { {p - value<sub>2</sub>, multiple hypothesis adjusted p - value<sub>2</sub>,
       True / False for statistical significance }, { {number of members in group being tested,
        number of successes for term<sub>2</sub> in population, total number of members in population,
        number of members (or more) in current group being tested associated to pathway2},,
       {KEGG pathway<sub>1</sub> description, {input IDs associated to pathway<sub>2</sub>}}}, ..., KEGG: pathway<sub>n</sub> \rightarrow
    \{\{p-value_n, multiple\ hypothesis\ adjusted\ p-value_n,\ True\ /\ False\ for\ statistical\ significance\},
      \{ number of members in group being tested, number of successes for term_n in population,
        total number of members in population, number of members (or more) in current group being tested
          associated to pathway<sub>n</sub>}, {KEGG pathway<sub>n</sub> description, {input IDs associated to pathway<sub>n</sub>}}}}
 |>
```

The input data can also be an association of multiple L groups to be tested:

```
data = \langle |Group_1 \rightarrow \{ID_{11}, ID_{12}, \ldots, ID_{1n_1}\},
       \mathsf{Group}_2 \rightarrow \{\mathsf{ID}_{21},\,\mathsf{ID}_{22},\,\ldots,\,\mathsf{ID}_{2\,n_2}\}\,,\,\ldots,
       Group_L \rightarrow \{ID_{11}, ID_{12}, \ldots, ID_{1n_L}\} \mid > .
```

In this case the output for each group has the listOutput format described above:

```
associationOutput = < |Group_1 \rightarrow listOutput_1,
   Group_2 \rightarrow listOutput_2, \ldots,
   Group, → listOutput, |>
```

KEGGAnalysis can also take as input the output of clustering of time series classification data, e.g. TimeSeriesClusters or TimeSeriesSingleClusters association of associations. The groups for each class will then have keys labeled "GroupAssociations", that include the labels used in the clustering. The labels must correspond to protein or gene accessions/IDs. For each class and group the corresponding KEGGAnalysis enrichment is computed and returned.

There are two types of analyses that are carried out, which can be set by the AnalysisType option value. The default "Genomic" analysis is based on input gene symbols. The "Molecular" analysis is based on molecular input accessions (e.g. compounds "cpd" databases). For multi-omic input the user may select to do All analyses. In this case an additional outer association is created with labels indicating each of "Genomic" or "Molecular" analysis carried out.

The enrichment analysis is an over-representation calculation, using a hypergeometric test. For a given a given group (e.g. members of a cluster after classification), we try to identify which KEGG pathway terms are over-representated by membership of IDs to that cluster. The KEGGAnalysis function allows us to select the background, and hence address selection bias. Additionally a Benjamini-Hochberg procedure false discovery rate (FDR) may be calculated for each representation.

We carry out our KEGGAnalysis for all the classes and groups/subgroups. We only report terms for which there are at least 2 members, and additionally correct for multiple omics (2 sets of KEGG terms, one each for proteomics and transcriptomics). Please note that this is a time consuming computation.

```
In[131]:= keggAnalysisCombined = KEGGAnalysis[combinedClusters,
           ReportFilter → 2, MultipleList → True, MultipleListCorrection → 2, AnalysisType → All];
```

We see that both "Molecular" and "Genomic" analysis is performed:

```
In[132]:= Keys@keggAnalysisCombined
Out[132]= {Molecular, Genomic}
```

We can extract both Genomic and molecular analysis:

```
In[133]:= keggAnalysisCombined["Genomic"]
```

```

The results from a MathIOmica time series clustering enrichment analysis can be exported to spreadsheets using EnrichmentReportExport.

EnrichmentReportExport [results]

exports results from enrichment analyses to Excel spreadsheets, particularly suited for exporting multi-omics TimeSeriesClusters enrichment analysis results (via KEGGAnalysis or GOAnalysis). An excel spreadsheet is generated for each Class, named after the Class key, with sheets created for and named after each Group in that Class containing the enrichment output for that Group.

Exporting the enrichment analysis results to spreadsheets

option name	default value	
AppendString	11 11	String that will be appended to the file name after the class name. If a string is not provided the current Date is appended.
OutputDirectory	None	OutputDirectory specifies the location of a directory to output the Excel spreadsheets generated by the function. If it is set to None the NotebookDirectory[] will be used as a default output directory.

Options for EnrichmentReportExport.

We can export the reports, for example to the \$UserDocumentDirectory:

In[136]:= EnrichmentReportExport[keggAnalysisCombined["Genomic"], OutputDirectory → \$UserDocumentsDirectory, AppendString → "KEGGAnalysisCombined"];

We can export the GO analysis results as well, for example to the \$UserDocumentDirectory:

In[137]:= EnrichmentReportExport[goAnalysisCombined,

OutputDirectory → \$UserDocumentsDirectory, AppendString → "GOAnalysisCombined"];

Visualization of Pathways from KEGG

MathIOmica allows visualization and coloring of KEGG pathways using KEGGPathwayVisual.

KEGGPathwayVisual[pathway]

generates a visual representation for a KEGG: Kyoto Encyclopedia of Genes and Genomes pathway.

Visualizing KEGG pathways.

option name	default value	
AnalysisType	"Genomic"	AnalysisType provides a selection for the type of analysis to perform. "Genomic" analysis (default) uses gene identifier based pathway visualization. "Molecular" analysis uses molecular analysis map visualization.
AugmentDictionary	True	AugmentDictionary provides a choice whether or not to augment the current ConstantGeneDictionary variable or create a new one.
BlendColors	{RGBColor[BlendColors provides a list of colors to be used in coloring intensities provided and is used by the IntensityFunction as its first argument. The colors must be provided as RGBColor[] specification.
ColorSelection	< "RNA" → "bg", "Protein" → "fg" >	ColorSelection assigns foreground and background colors in the KEGG pathway through an association. The Keys point to labels for multi-omics data, and the values "bg" and "fg" can point to background and foreground representations respectively for each key.
DefaultColors	{"fg" -> RGBColor[DefaultColors provides a list of rules for setting the colors to be used as default values for the foreground "fg" and background "bg" respectively in the generated pathways. The colors must be provided as RGBColor[] specification.
ExportMovieOptions	{"VideoEncoding"→ "MPEG-4 Video", "FrameRate"→1}	ExportMovieOptions provides options for the Export function used internally to export the pathway list when Intensities have been provided for a time series representation of data.
FileExtend	".mov"	FileExtend provides a string to be appended to the file name if the ResultsFormat is set to "Movie".

"bg" SingleColorPlace SingleColorPlace selects in the case of a single identifier input whether to place the color to the foreground, ("fg") or background ("bg" set by default). Species "human" The Species option specifies the species considered in the calculation. StandardHighlight {"fg" -> RGBColor[StandardHighlight provides a list of rules for setting the highlight colors for the IDs represented in the 1, 0, 0], "bg" -> pathway (when no intensities are provided). The list RGBColor[0.5, specifies color rules for foregroung, "fg", and 0.7, 1]} background, "bg", respectively. The colors must be provided as RGBColor[] specification.

 ${\tt Options} \ {\tt for} \ {\tt KEGGPathwayVisual} \ .$

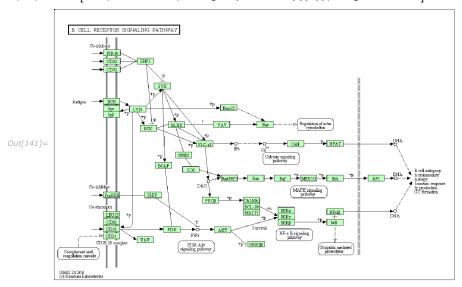

ResultsFormat option setting	"Results" value for returned data	
"URL"	Browser URL pointing to pathway on KEGG database, or if a list of Intensities was provided a series of URLs corresponding to each time point or sequential data in the series.	
"Figure"	Pathway figure downloaded from the KEGG database, or if a list of Intensities was provided a series of figures corresponding to each time point or sequential data in the series.	
"Movie"	Name of the output file that contains the generated movie/animation that is based on the list of Intensities provided.	

ResultsFormat option output for KEGGPathwayVisual

```
For example, we can look at the B-cell receptor pathway:
 In[138]:= exampleBCellReceptor = KEGGPathwayVisual["path:hsa04662"]
 \textit{Out} \texttt{[138]=} \\ <| \texttt{Pathway} \rightarrow \texttt{path}: \texttt{hsa04662}, \texttt{Results} \rightarrow \\ \{\texttt{http://www.kegg.jp/kegg-bin/show\_pathway?map=hsa04662} \}| > \\ | \texttt{Pathway} \rightarrow \texttt{pathway} \rightarrow \texttt{pathway} + \texttt{pathw
                                                            We can open this in a browser:
  In[139]:= SystemOpen[exampleBCellReceptor["Results"][[1]]]
                                                              We can import directly the pathway:
   In[140]:= exampleBCellReceptorFigure = KEGGPathwayVisual["path:hsa04662", ResultsFormat → "Figure"]
Out[140]= ( Pathway - path hea04562, Resulte ->
```

We can zoom in:

In[141]:= Show[exampleBCellReceptorFigure["Results"][[1]], ImageSize \rightarrow 500]

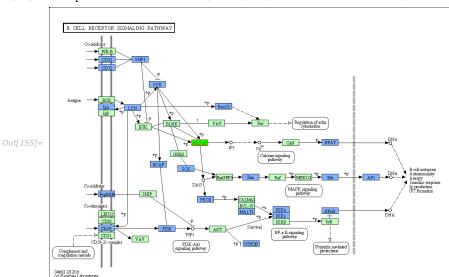

We can highlight the components:

In[154]:= exampleBCellReceptorFigureHighlight = KEGGPathwayVisual["path:hsa04662", ResultsFormat → "Figure", MemberSet → Query["SpikeMin", 3, 1]@keggAnalysisCombined["Genomic"], ORA → True]

We can zoom in:

In[155]:= Show[exampleBCellReceptorFigureHighlight["Results"][[1]], ImageSize → 500]

We can also create snapshots and an animation of this data.

First, let's extract the members of the pathway in the analysis:

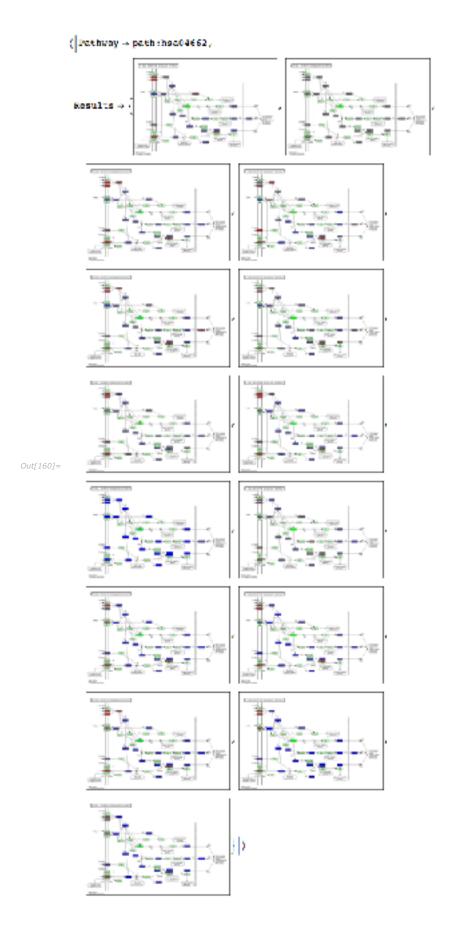

```
In[156]:= membersBCellReceptor = (Query["SpikeMin", 3, 1, 3, 2]@keggAnalysisCombined["Genomic"])[[All, 1]]
Out[156]= {{CD72, RNA}, {CD19, RNA}, {CD22, RNA}, {IKBKG, RNA}, {CD79A, RNA}, {PIK3R1, RNA}, {PIK3CG, RNA},
             {MAPK1, RNA}, {PRKCB, RNA}, {CHUK, RNA}, {SOS1, RNA}, {MALT1, RNA}, {NFATC2, RNA}, {KRAS, RNA}, {NRAS, RNA},
             {NFKB1, RNA}, {DAPP1, RNA}, {P16885, Protein}, {JUN, RNA}, {FOS, RNA}, {NFATC3, RNA}, {SOS2, RNA},
              \{ \mathsf{GSK3B}, \, \mathsf{RNA} \}, \, \{ \mathsf{PIK3CA}, \, \mathsf{RNA} \}, \, \{ \mathsf{SYK}, \, \mathsf{RNA} \}, \, \{ \mathsf{PIK3AP1}, \, \mathsf{RNA} \}, \, \{ \mathsf{LYN}, \, \mathsf{RNA} \}, \, \{ \mathsf{FCGR2B}, \, \mathsf{RNA} \}, \, \{ \mathsf{PTPNG}, \, \mathsf{RNA} \} \}
```

First, let's extract the members of the pathway in the analysis:

In[157]:= intensitiesRNABCellReceptor = DeleteMissing[Query[Key[#] & /@ membersBCellReceptor] @ rnaFinalTimeSeries]; intensitiesproteinBCellReceptor = ${\tt DeleteMissing} \big[{\tt Query[Key[\#] \& /@ membersBCellReceptor]@proteinFinalTimeSeries];} \\$ intensitiesAll = Join[intensitiesRNABCellReceptor, intensitiesproteinBCellReceptor]

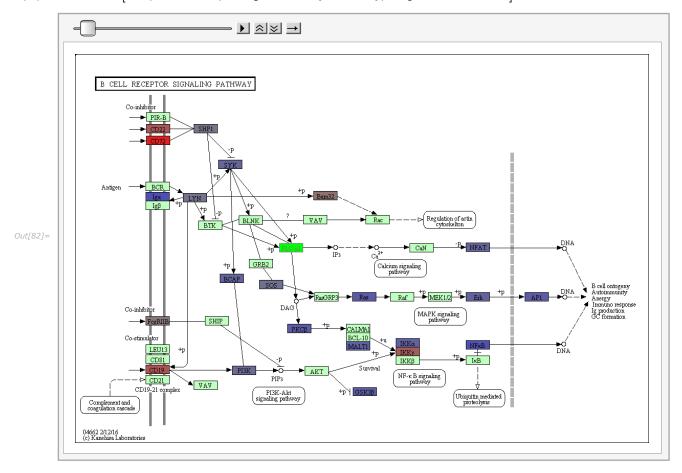

```
Out[159] = \langle | \{CD72, RNA\} \rightarrow \{0.369636, 0., 0.261993, 0.0820577, 0.224604, 0.0603929, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008, 0.192008

```

We can now extract and plot the sequence of figures:

We can use ListAnimate to generate a movie/animation of the results

In[82]:= ListAnimate[exampleBCellReceptorFigureTimeSet["Results"], ImageSize \rightarrow Automatic]

We can set the ResultsFormat to "Movie" to output a movie version:

In[161]:= KEGGPathwayVisual["path:hsa04662", ResultsFormat → "Movie", MemberSet → membersBCellReceptor, Intensities → intensitiesAll

 $Out[161] = \langle | Pathway \rightarrow path:hsa04662, Results \rightarrow path_hsa04662.mov | \rangle$
